vĭl'-lĕn-age (age as **ĭj),** *s.* [VILLAIN.]

1. *Feudal Law:* A tenure of land by base services; the tenure of a villain. It was of two kinds: (1) pure villenage, where the service was base in its nature and undefined as to time and amount, and (2) privileged villenage (also called villein socage), in which the

service, although of a base nature, was certain and defined. When lands held in villenage descended from father to son in uninterrupted succession, the occupiers or villeins became entitled by prescription or custom to hold their lands against the lord, so long as they performed the services required of them under their tenure, and according to the custom of the manor. These customs were preserved and evidenced in the rolls of the several courts-baron in which they were entered or kept on foot by the constant immemorial usage of the several manors in which the lands lay. Tenants holding such lands, having nothing to show as title to their estates but the entries in these rolls, or copies of them authenticated by the stewards, came in time to be called tenants by copy of court-roll, and their tenure copyhold. 1. *Botany:*

(1) The genus Vitis (q.v.), and spec. *Vitis vinifera*, the Common or Grape Vine. It is a climbing plant furnished with tendrils. The leaves are lobed, pinnately toothed, naked, or downy; the flowers, as in other species, small, greenish, in panicles opposite the leaves; its berries, called grapes, oval, large, juicy, growing in clusters or bunches, are the finest of fruits. The native country of the vine is the region south of the Caspian Sea, Armenia, and the adjacent regions, extending perhaps to the north-western Himalaya. From a very early period, it was cultivated in Western Asia and Egypt (Gen. ix. 20, 21; xl. 10), whence it has spread to all the parts of the world suitable for its cultivation. It thrives best on the sunny sides of hills between 32° and 50° N. Its fruit is made into wine or brandy; the dried fruits of some varieties constitute raisins [RAISIN], while those of another variety are the currants of commerce [CURRANT]. The eastern United States is richer in species of the vine than any other part of the world, having seven or eight species, four of which have yielded promising cultivated varieties. These are the Northern Fox-grape (*V. labrusca*), the Muscadine, or Southern Fox-grape (*V. vulpina*) the summer grape (*V. æstivalis*), and the Winter, Chicken or Frost grape (*V. cordifolia*). Many valuable varieties have been produced by cultivation, as the Concord, Catawba, Delaware, &c. In California the European grape has been introduced, and is extensively cultivated, much wine being made.

(2) The long slender stem of any plant that trails along the ground, or climbs and supports itself by winding round a fixed object, or by seizing any fixed thing by its tendrils, or clasps: as a hop *vine*, a cucumber *vine*, &c.

vine-disease, *s.*

Vegetable Pathol.: Any disease attacking the vine, spec.:

(1) That produced by the attacks of *Oidium Tuckeri.* [VINE-MILDEW.] In general it forms a white and very delicate cottony layer upon the leaves, young shoots, and young grapes of the vine, which soon causes them to be covered by brown spots, and then become first indurated and finally destroyed. The fruit becomes abortive, or dwarfed and juiceless, and decay follows. There is a predisposition to the disease in certain states of the atmosphere. It first broke out in Kent in 1845, whence it spread to the continent of Europe, to Madeira, and to the English vines introduced into America, though American vines themselves escaped. Soon after its appearance, Mr. Tucker, a gardener at Margate, was the first to try sulphur as a remedy. It is still the best known, and the fungus has been named after its human destroyer.

(2) A disease of the vine produced by an aphis, *Phylloxera vastatrix.* [PHYLLOXERA.] The parasites cause the roots to swell, and finally to be incapable of discharging their functions, so that the plant wastes away or perishes. They are as difficult to destroy as other aphides. *Phylloxera* is a native of America, but has been exported to Europe, where it has caused great ravages in the vineyards, almost annihilating the vine in some districts of France. As a means of overcoming its effects, the stocks of some of the hardy American species have been planted, and grafted with the European vine. This method has proved very successful.

vĭn'-ĕ-gąr, *vĭn'-ĕ-gĕr, *vin-e-gre, *vyn-e-gre, *s.* & *a.* [Lit. = sour wine, from Fr. *vinaigre* = vinegar, from *vin* = wine, and *aigre* = sharp, sour.]

A. *As substantive:*

1. *Lit.:* A weak solution of acetic acid, containing in most cases a certain proportion of extractive matter and mineral salts, according to the source from which it has been derived. Malt vinegar contains from four to six per cent. of real acetic acid, which is produced by the action of the acetous ferment on a fermented extract of malt and grain. It is usually of a deep red-brown colour, and is the kind of vinegar most esteemed by the public. Wine vinegar made in France by the acetification of poor and weak wines, contains usually the same amount of acetic acid as malt vinegar, but possesses a different flavour. A great deal of French vinegar is prepared from crabs or sour apples, but it has neither the flavour nor the strength of that made from wine. Cider vinegar, largely used in the cider districts of this country, is prepared by adding sugar to a very acid cider, and allowing it to stand in a warm room for some time, or is simply expressed from crab apples, when it is known as crab-vinegar. German vinegar is made by passing weak alcohol over wood shavings in presence of air. The acetification proceeds much more rapidly than in the case of malt vinegar, but the flavour is not so good. Distilled vinegar (white vinegar), *i.e.*, malt or wine vinegar, which has been subjected to distillation, contains from five to seven per cent. of acetic acid, and also some of the essential principles present in the vinegar from which it is derived. Wood vinegar is crude acetic acid produced in the destructive distillation of wood. When highly purified and diluted, it is not unfrequently sold as white vinegar. [ACETIC-ACID.] Vinegar is largely used as a condiment in cookery, salads, &c., and as a preservative ingredient in pickles. Taken internally, it is a refrigerant. Much diluted, it may be used to sponge the body in fever, to check excessive perspiration, and as an ingredient in cooling lotions.

Viol* and *fiddle* are doublets.]

Music: A stringed instrument a little larger than the violin; it was furnished in England with five or six strings, had a fretted finger-board, and was played with a bow. The viol is found depicted in MSS. as early as the eleventh century. In France, Germany, and Italy the number of the strings varied between three and six. It is supposed that they were tuned in fourths and thirds. A chest of viols consisted of six instruments of various sizes, the smaller ones were called in England treble, the next mean, and the larger bass viols: the treble viol was somewhat larger than the violin, and the music for it was written in the treble clef; the mean (or tenor) viol was about the same length and breadth as the modern tenor violin, but was thicker in the body; its music was written in the C clef. The bass viol was much about the same size as the violoncello, and the music for it was written in the bass clef.

vī'-ō-la (2), *s.* [Lat. = a violet.]

Bot.: Violet; the typical genus of Violeæ (q.v.). Low herbs, more rarely shrubs, with radical or alternate leaves or flowers; on one, rarely on two-flowered peduncles; calyx of five sepals, extended at the base; petals five, unequal, the under one spurred at the base; anthers connate, two of them spurred behind; capsule of three elastic valves; seeds ovoid or globose. Known species about two hundred, from temperate countries. Several of these are cultivated in gardens, some of them, as *V. tricolor*, known by the several popular names of Pansy, Pansy Violet, and Hearts Ease, being admired for the beauty of their flowers; others, as *V. odorata*, the Sweet-scented Violet, for their delicate perfume. There are a number of species native to the United States, of which *V. cucullata*, the common Blue Violet, is much the best known. Other common species are *V. palmata*, the Hand-leaf Violet, and *V. pedata*, the Bird's-foot Violet, which bears large and handsome blue or purple flowers. There are several species of white and yellow violets, the latter including *V. rotundifolia* and *V. pubescens*. Of the white species, *V. blanda* bears small white flowers with a faint, sweet perfume. There are species with green flowers, belonging to a second genus, *Solea*. The cultivated violets are principally of Old World species, notably the Pansy and the Sweet-scented Violet. The Pansy is remarkable for its great diversity of coloration, and there is no more admired garden flower. The bruised leaves of *V. tricolor* smell like peach kernels; they were once believed to be efficacious in the cure of skin diseases. The petals of *V. odorata* are used as a laxative for children. The seeds have similar qualities, and the root is emetic and purgative. *V. serpens*, a small, procumbent, Himalayan herb, yields an oil. The flowers are considered diaphoretic and laxative, the seeds diuretic and emetic.

Bot. (*Pl.*): The order Violaceæ. (*Lindley.*)

vī'-ō-lĭn (1), *s.* [Ital. *violino*, dimin. from *viola* = a viol (q.v.).]
Music: The most familiar of all stringed instruments played with a bow. It is somewhat smaller than the old viol, as its name implies. Like the rest of the family it represents, it consists of a wooden chest of peculiar form, made of two curved surfaces, called the back and the belly, united by sides, and with a hollow on each side half-way in the length. A neck at one end serves as a finger-board, over which the four strings pass, being fastened at one end of the chest or body to a tail-piece, and kept in tune and position by a series of pegs at the head or end of the neck. The strings are raised above the belly by the bridge, supported at the point of greatest tension by a sound-post, which is fixed upright between the back and the belly. In the belly are two holes, called the *f* holes from their similarity to the shape of that letter. The sound is produced by drawing a bow of horsehair charged with rosin across the strings, which are tuned in fifths, the changes of pitch being gained by "stopping" the strings with the fingers of the left-hand against the finger-board, thus shortening the vibrating portion of the string. The harmonics of the violin are very telling in quality, and are produced by touching the strings lightly instead of pressing them upon the finger-board. The sordino or mute, placed upon the bridge, produces a peculiar modification of tone, and a special effect is gained by plucking the strings, as in playing a guitar. [PIZZICATO.] The violin is capable of producing a limited harmony by means of double stops and bowing in "arpeggio," while as to power of expression and execution there is no other instrument which can be compared to it. It has a wide range of sounds, to which any degree of loudness or softness, staccato or legato, can be given. Compass from G below the stave. [CREMONA.]

"There are two cases relative to the direction of rays reflected by mirrors according as the rays after reflection are convergent or divergent. In the first case the reflected rays do not meet, but if they are supposed to be produced on the other side of the mirror, their prolongations coincide in the same point. The eye is then affected, just as if the rays proceeded from this point, and it sees an image. But the image has no real existence, the luminous rays do not come from the other side of the mirror; this appearance is called the *virtual image*. The images of real objects produced by plane mirrors are of this kind."—*Guncl: Physics* (ed. *Atkinson*), § 506.

Mech.: The velocity which a body in equilibrium would actually acquire during the first instant of its motion in case of the equilibrium being disturbed. The proposition known as the Principle of Virtual Velocities is thus stated:

"Suppose a system of forces in equilibrium, and imagine the points of application of the forces to undergo very slight displacements, then the algebraical sum of the products of such force into its virtual velocity vanishes; and, conversely, if this sum vanishes for all possible displacements, the system of forces is in equilibrium."

Suppose that A is the point of application of a force P; conceive the point A to be moved in any direction to a new position, a, at a very slight distance, and from a draw a perpendicular, ap, on the line of action of the force P; then Ap is called the virtual velocity of the point A with respect to the force P; and the complete phrase is abbreviated, sometimes into "the virtual velocity of the point A," and sometimes into "the virtual velocity of the force P." The virtual velocity is considered to be positive or negative according as p falls in the direction of P or in the opposite direction. Thus in the figure the virtual velocity is positive. Vĭsh'-noō, Vĭsh'-nū, *s.* [Sans., from *vis* = to enter, to pervade.]

Brahmanism: The second person of the modern Hindoo Trimurti (q.v.). When he first appears in Vedic times, he is simply the God of the Shining Firmament, the younger brother of Indra, and inferior to him in dignity. By the time that the epic poems, the Ramayana and the Mahabharat, were composed, Vishnoo had made a considerable advance to his present position, the full attainment of which, however, was reserved for the period of the Puranas. One of these books is called the Vishnoo Purana. He is regarded as the member of the Triad whose special function is to preserve. To do this he nine times successively became incarnate, and will do so once more. The first time he appeared, it was as a fish to warn a righteous king, Manu, of an approaching deluge, and save the sacred Vedas from being lost. His second appearance was as a tortoise to support the world, while the gods and goddesses churned the sea; the third, as a boar, to lift up the submerged world on his tusks; the fourth, as a man-lion, to tear to pieces an impious king; the fifth, as a dwarf, to recover for the gods their supremacy lost by their neglect; the sixth, as Parasurama, to wash away the sins of the earth by the destruction of the Kshatriya race—probably an allusion to the historic fact that when the Aryan Brahman and Kshatriya warriors had well established themselves in India, jealousies arose between them, and the Kshatriyas were vanquished, and in large measure destroyed, by the Brahmans; the seventh, was as Rama, the hero of the Ramayana; the eighth, as Krishna; the ninth, as Booddha; and the tenth, as Kalki, or the White Horse, is still to come. When it arrives, Vishnoo shall appear on a white horse, with a drawn sword, wherewith he shall destroy the wicked, and thus prepare the way for a renovated world. Vishnoo himself is generally represented as a dark-blue man, with four arms, the first holding a war-club, the second a conch-shell, the third a quoit-like weapon called Chakra, and the fourth a water-lily. His two most popular incarnations are as Rama and Krishna. His most enthusiastic followers are generally drawn from the middle classes of Hindoo society. His mark on their foreheads is a trident, with a yellow fork in the centre, and a white one on each side. Many monastic sects worship him almost exclusively. [VAISHNAVA.]

5. Anything unreal or imaginary; a creation of fancy.

¶ *Vision* is the act of seeing or the thing seen; *apparition*, the thing that appears. *Vision*, signifying a thing seen, is taken for a supernatural exertion of the *vision; apparition* refers us to the object seen, which may be true or false, according to the manner in which it presents itself. It may be convenient to use the terms '*vitality*' and 'vital force' to denote the causes of certain great groups of natural operations, as we employ the names of 'electricity' and 'electrical force' to denote others; but it ceases to be proper to do so, if such a name implies the absurd assumption that either 'electricity' or '*vitality*' are entities playing the part of efficient causes of electrical or vital phenomena."—*Huxley: Anat. vitrified forts, *s. pl.* A class of prehistoric hill fortresses, principally found on the crests of hills in the Scotch Highlands, but occurring also in France, the walls of which are partially or entirely transformed into a glassy substance. M., Esq., Edinburgh, by Mr. John Williams, a civil engineer, who was then conducting mining operations in the Scottish Highlands under the Board of Annexed [*i.e.,* Forfeited] Estates. Williams's discovery was first doubted, then discussion arose whether the vitrified forts were extinct volcanoes or artificial productions. Now the volcanic hypothesis is quite exploded, and the erections are regarded as old forts. vĭv-ĭ-sĕc'-tion, *s.* [Lat. *vivus* = alive, and *sectio* = a cutting, a section (q.v.).]

Natural Science:

1. A term denoting, in its strict signification, the dissection of living animals, but popularly employed to denote the practice of performing operations with the knife on living animals, with the view (1) of increasing physiological knowledge; (2) of converting speculative into positive conclusion; and (3) of acquiring manual dexterity in operative surgery. In this last sense vivisection is principally confined to the French veterinary schools. By biologists the term is extended to include the performance of all scientific experiments of a kind calculated to inflict pain upon living animals, and having for their object the investigation of the laws which govern life, the processes of disease, the action of heat and cold, poisons, and therapeutic remedies. The practice appears to have been introduced by the Alexandrian School in the fourth century B.C.; and to this practice we owe, among many other benefits, the discovery of the circulation of the blood by Harvey; the treatment of aneurism by ligatures by Hunter; the distinction of the sensory and motor nerves by Bell; the introduction of chloroform; and the improved treatment of cerebral diseases which resulted from the researches of Brown-Sequard and Bernard. It has also been highly valuable in the study of the reproduction of bone, digestion and secretion, the effects of brain excitation, the investigation of parasitic and contagious diseases, the action of poisons, drugs and medicines, and many other matters of importance in connection with modern surgery and medicine. There is much opposition to vivisection, and vivisectors generally admit the necessity of observing the following conditions: (1) That the experimenter should be a skilled anatomist and physiologist; (2) That anæsthetics should be used where possible; and (3) That when a physiological fact has been determined, exhibitions of the experiments by which it was determined are unnecessary and, therefore, unjustifiable. An Anti-vivisection Society was founded in 1875 and another in 1876. (*Haydn.*)

2. Any painful scientific experiment performed upon a living animal.

II. *Technically:*

1. *Physiol.:* A sound emitted from the larynx (q.v.), which is the organ of voice. To produce it a blast of air, driven by a more or less prolonged expiratory movement, throws the vocal cords (q.v.) into vibration, they again imparting their vibrations to the column of air above them. When a note is to be uttered the vocal cords become parallel to each other, and thus more easily vibrate by a moderate blast of air. The true vocal cords and the parts of the larynx which affect them constitute the essential vocal apparatus, whilst the parts above- viz., the ventricles of the larynx with the false vocal cords, the pharynx, and the cavity of the mouth—constitute a resonance tube. In a voice are to be distinguished loudness and pitch, the former dependent on the strength of the expiratory blast, the latter on the length and degree of tension of the vocal cord. The shrill voice of a child arises from the shortness of its cords in infancy; soprano, tenor, and baritone voices also depend respectively on the length of the cords, those of a man being about one-third longer than those of a woman or of a boy. The breaking of the voice at puberty arises from the rapid development of the larynx.

2. *Gram.:* That form of the verb or body of inflections which shows the relation of the subject of the affirmation or predication to the action expressed by the verb. In English and many other languages there are two voices—active and passive (see these words); in Greek and some other languages there is a third voice—the middle (q.v.).

3. *Music:* Voices may be arranged in six orders or classes, according to gravity or acuteness, viz., the bass, barytone, tenor, alto, or contralto, mezzo-soprano, and soprano (see these words). The first three are the natural voices of men, and the second three those of women. The compass or range of notes is different in each voice, but it is not compass alone which determines the class to which any voice may belong, as very frequently a barytone quality of voice is limited to the range of a bass, and a tenor quality to the compass of a barytone.

4. *Phonetics:* Sound uttered with resonance of the vocal chords, and not with a mere emission of breath; sonant utterance.

¶ * (1) *In my voice:* In my name. (*Shakesp.: Measure for Measure*, i. 3.)

VOLANT PIECE.

Vŏl-a-pŭk', *s.* [From two words in the new language, *vol* = world, universe, and *pŭk* = speech, discourse, language.] An attempt to form a universal language by Johann Maria Schleyer, a German priest, by a selection of words from most of the European languages, English in particular. The difficulties of pronunciation are obviated by making each letter have only one sound, and words are always written as they are pronounced, and pronounced as they are written. The alphabet consists of twenty-seven letters, eight being vowels and nineteen consonants. The consonants are sounded as in English, with the exception of *c*, which always has the sound of *ch* as in *child; j*, which always has the sound of *sh*, as in *shade;* and *g*, which is always hard; *h* is used as an aspirate. The accent is invariably on the last syllable, and to the simple French construction is added the advantage of only one conjugation, and there are no irregular verbs or artificial genders. The method of derivation is always the same. The adjectives, verbs, and adverbs being regularly formed from the substantive and analogous in termination, a knowledge of all the nouns practically means the acquirement of the language. *W* becomes *v*, and, for the benefit of eastern peoples to whom the pronunciation of *r* is always a stumbling-block, *l* is generally substituted for it. The words are generally reduced to one syllable: thus *fat* = father, *dol* (Lat. *dolor*) = pain, *gan* (Ger. *gans*) = goose. Nouns have but one declension and only four cases; gender is indicated by the prefix *of:* thus, *tidel* = schoolmaster, *of-tidel* = schoolmistress. Adjectives are formed by adding *ik* to the substantives, and adverbs by adding *o* to the adjectives: thus, *fam* = glory, *famik* = glorious, *famiko* = gloriously.

Vŏl-a-pŭk'-ĭst, *s.* [Eng. *Volapük; -ist.*] An advocate of the adoption of Volapük as a universal language.

¶ Volapük was at first very popular, there being many thousands of students, numerous dictionaries and grammars, over 20 newspapers printed in it, and associations for its practice and extension in most civilized lands. This progress has since been checked, the feeling being that Volapük does not fill the requirements of a world language.

Another extends from the Aleutian Islands to the Moluccas and the Isles of Sunda, another from Central Asia to the Canary Islands and the Azores. There is one in the Grecian Archipelago, having its chief focus at Santorin, known to have been active at intervals for two thousand years; then that of Italy and Sicily, having vents in Etna, Vesuvius, and Ischia. One region is in Iceland, with Hecla as its chief vent. Volcanoes are generally near the sea. Jorullo, in Mexico, is, however, an exception, being 120 miles from the nearest ocean.

Old volcanic rocks are so nearly identical with the products of modern volcanoes, that the two were undoubtedly produced in a similar manner. The leading volcanic rocks are basalt, andesite, and trachyte.

vŏl-cā′-nō, *s.* [Ital. *volcano, vulcano*, from Lat. *Volcanus, Vulcanus* [VULCAN]; Sp. & Fr. *volcan.*]

1. *Geol.:* A more or less perfectly conical hill or mountain formed by the successive accumulations of ejected matter in a state of incandescence or high heat, and having one or more channels of communication. (*Lyell.*) Volcanoes are of three kinds: Active, Dormant, and Extinct. An active volcano is one which still continues at intervals to break into eruptions. A dormant volcano is one which after being quiescent for a long interval, as if its fires were extinct, then breaks forth anew. An extinct volcano is one not known to have been in eruption since man has been upon the earth. The connection between earthquakes and volcanoes is so close that intense seismic action occurs only in the regions where volcanoes exist. [VOLCANIC-REGIONS.] Earthquakes often precede volcanic eruptions, and become less violent when the volcano in the vicinity breaks forth, as if the explosive material struggling to obtain room for expansion produced the earthquake, and found vent in the volcano. Thus a volcano is a natural safety-valve, and saves vastly more human lives than it destroys. The following is the hypothetical genesis of a volcano. Some seismic convulsion produces a deep fissure in the ground, communicating beneath with a lake of molten matter. From this aperture lava flows forth, showers of scoriæ or ashes, dust, and sand are hurled into the air, boiling water rises in enormous jets, steam and various gases ascend. Certain of these materials, such as the ashes, the sand, and the dust falling around the aperture, form a tiny eminence, the sides of which slope at the highest angle at which falling material can rest without sliding to the bottom. By this process repeated an indefinite number of times a hill tends to arise of a conical form, and the fissure, whatever its original form, to become a round crater. The first flow of lava from a fissure on a plain would be nearly horizontal, but, as there arose a volcanic cone of material which, though loose at first would tend to cohere, it would descend the slope at an angle. Earthquakes continually upheave regions or districts, and might aid in raising the small volcano to a higher elevation above the sea. Similar action might in certain cases produce what have been called "craters of elevation," but those of eruption are far more numerous. Then when the volcano becomes elevated the pressure of the lava is so great as to break through the side of the crater, and allow the molten mass to escape by a fresh aperture, around which a minor cone is produced. Eighty such minor cones are known on the flanks of Etna. The top of a volcano may also fall in and disappear. A small volcano may arise in a night, as did Monte Nuovo 450 feet high, in the Phlegræan fields near Naples, in 1538, but an immense lapse of time is needful to build up such a mountain as Etna (height 10,874 feet) or Cotopaxi (18,858 feet). About three hundred active volcanoes are known. Besides these there are submarine volcanoes, which occasionally come to the surface of the sea, as did Graham's Island, in the Mediterranean near Sicily, in 1831. Volcanoes have existed in all bygone geological ages. Arthur's Seat, near Edinburgh, is an old volcano, its summit being formed by lava formerly filling the hollow of the crater, but from which the softer material of the cone has in some submergence been washed away.

2. *Fencing*: A sudden movement or leap to avoid a thrust.

vŏlt (2), *s.* [Named in honour of Alessandro Volta.] [VOLTAIC.]

Elect.: The unit which expresses difference of potential. An electrical current is in many respects analogous to a flow of water. The fundamental unit (UNIT, ¶ 4.) is one of mere quantity, the Coulomb, and merely expresses sufficient current to do a certain amount of work. But the same quantity of water would flow through a large pipe at one inch per second, and through one half the diameter at four inches per second. Hence we get the unit expressing quantity per second (the ampère); and thirdly, as a greater pressure or force is required to drive water at a given rate per second through a small pipe, or greater resistance, so as to maintain a given quantity per second, in electrical currents we have this force or pressure, considered as the difference of potential or electrical pressure at the two ends of the circuit of wire. The resistance of a wire to the passage of a current is measured in ohms (units), and a volt is the difference of potential required to drive an effective current of one ampère through a wire interposing the resistance of one ohm.

vŏlt'-mē-tĕr, *s.* [Eng. *volt* (2), and *meter.*]

Elect.: Any instrument for measuring the pressure, electromotive force, or difference of potentials at the ends of an electric current. The gold-leaf electroscope is a kind of voltmeter, but will only measure large differences of potential. If the terminals are connected with flat plates arranged parallel to each other, one of which is movable, the attractive force between the plates at a given small distance will be a voltmeter. This method is too coarse for ordinary currents, but a modification of it is employed in Thomson's quadrant electrometer. In Cardew's voltmeter the heating effect of the current in a wire, which varies with the electromotive force, and is measured by the expansion produced, is employed. In the majority of instruments the electro-magnetic action is employed in some form of galvanometer. These are more usually wound to act as ammeters, but if wound with very thin wire the high resistance allows the electromotive force required to drive a certain current through them to be callibrated and denoted in volts. Such instruments are adjusted or callibrated by comparison with a "standard" voltaic cell or voltameter.

A very simple volumenometer consists of a globular flask with a narrow neck, about twelve inches long, and graduated from below upwards to indicate grains of water. The flask has a tubulure, accurately fitted with a ground stopper for admitting the solid body to be measured. The instrument being filled to the mark 0° on the neck with a liquid, as water, which does not act upon the solid, it is inclined on one side, the stopper removed, and the solid body introduced. The stopper is then replaced, and the number of divisions through which the liquid is raised in the stem gives at once the volume of the body in grain-measures.

voluntary-affidavit (or **oath**), *s.*

voluntary-controversy, *s.*

Church Hist.: A controversy which arose in Scotland in 1831 with regard to the mutual relations which should subsist between the Civil Government and the Church. About the year 1780 a member of the Burgher denomination [BURGHER] published a pamphlet, in which he advocated what is now called Voluntaryism (q.v.), and in May, 1795, proposed a modification of the Confession of Faith in conformity with the new views. The Synod ultimately granted the prayer of the petition, a minority withdrawing in 1799 and becoming known as the Old Light Burghers. The same change of views appeared with similar results somewhat later among the Antiburghers. In May, 1804, they superseded their "Act and Testimony," which was in favour of Establishments, by the "Narrative and Testimony," the acceptance of which they made a condition of Communion. Four ministers withdrawing in 1806, formed themselves into the Constitutional Associate Presbytery. The two denominations, which had on one point modified their creed, joining in 1820, became the United Secession. Up till this time, and for some years subsequently, the Voluntary Controversy had attracted little notice, but in 1831 it began to excite great attention throughout Scotland, the leading ministers of the Established Church on the one hand, and those of the United Secession on the other, carrying it on with the greatest ardour. The controversy had far-reaching consequences. To a certain extent it was to strengthen the Established Presbyterian Church on points on which its "voluntary" assailants had declared it weak that Dr. Chalmers proposed the Veto Act (q.v.), with the unexpected result of ultimately producing the Disruption. In the contest on the part of English Nonconformists for "religious equality" they maintain essentially the same views as the Scottish United Secessionists did in the Voluntary Controversy. [LIBERATION-SOCIETY.]

They are the muscles of locomotion, respiration, expression, and some others. (*Quain.*) [MUSCLE.]

voluntary-principle, *s.* The principle of Voluntaryism (q.v.).

voluntary-schools, *s. pl.* Public elementary schools managed by voluntary bodies (mainly religious), the cost of such schools being partly defrayed by voluntary subscriptions. Until 1870 all elementary schools were

of this nature. In that year, however, education was made compulsory by the Education Act, and board schools came into existence. Voluntary and board schools agree in the following points :

1. The average weekly fee must not exceed 9d., and the average attendance must not be less than 30.
2. Religious instruction is subject to a "conscience clause," and can only be given at the beginning or end of school.
3. The head teacher must be certificated.
4. The schools are annually examined and reported on by a Government inspector, who may also visit any school at any time.
5. A money grant is made by Government to the schools approved of by the inspector; such grant being assessed according to merit.

In the decade between August, 1876, and August, 1886, the voluntary schools rose from 12,677 to 14,620 (an increase of about 15 per cent), and the board schools from 1,596 to 4,402 (or about 175 per cent.).

voluntary-waste, *s.*

vŏl'-ŭn-tạr-ў-ĭşm, *s.* [Eng. *voluntary; -ism.*]

† 1. *Ord. Lang. :* Spontaneity (q.v.).

"He said *voluntaryism* was a most precious ingredient in all good works, but it needed regulation by authority."—*Victoria Magazine*, Nov., 1866, p. 64.

2. *Theol. & Church Hist. :* The view or tenet that the Church should derive its support only from the voluntary contributions of its members, and cannot, without becoming a party to political injustice, losing its own liberty, and running the risk of having its purity corrupted, ask or accept establishment, endowment, or financial support from the State, or from inferior civil authorities. Carried out with logical rigour, voluntaryism should also decline to permit its churches and Sunday-school buildings to be exempt from the payment of rates. This extreme view is entertained only by individuals : the immense mass of those who profess Voluntaryism hold that this limited amount of support or endowment is indirect, and need not be rejected. [VOLUNTARY-CONTROVERSY.]

"Elsewhere in Scotland the same conviction has led to a farewell to establishment, and to a *voluntaryism* more consolidated than any other in Europe."—*Pall Mall Gazette*, Aug. 21, 1884.

* **vŏl'-ŭn-tĕ,** * **vŏl'-ŭn-teĕ,** *s.* [VOLUNTY.]

vŏl ŭn-teēr', *s.* & *a.* [Fr. *voluntaire* = a volunteer, from Lat. *voluntarius* = voluntary (q.v.).]

A. *As substantive :*

1. One who enters into any service, or undertakes any duty of his own free will.

"Honest instinct comes a *volunteer*."
Pope : Essay on Man, iii. 83.

2. Specifically, one who of his own free will offers his services to the state in a military capacity, without the stipulation of pay or other substantial reward. Only two modern countries, the United States and England, depend largely upon Volunteers to supply the place of a large standing army. In the several nations of the continent of Europe military duty is enforced, all able-bodied citizens being held liable and required to become trained as part of the regular army. The United States and England, on the contrary, have each a small standing army of voluntary recruits, and trust for further military duty to the patriotic spirit of their citizens, and to the training of their volunteer organizations of citizen soldiery. The military efficiency of a nation without a large standing army was remarkably proved in the American Civil War, whose armies on both sides were almost entirely made up of volunteer soldiery, and in which the courage and ability displayed were all that could be desired. Since this war much attention has been paid to military drill, each state having its own body of state militia, well trained and equipped, and required each year to go through a certain course of camp duty. The whole body thus organized is sufficient in number to make an excellent nucleus of an army in case of war. In Great Britain dependence is placed on a similar body of citizen soldiery, whose organization in its present form was due to a war scare in 1859, which brought a large force of armed volunteers spontaneously into the field. Since that date the volunteer organization has been kept up, and a considerable body of well drilled citizen soldiery now exists.

Bot.: A family of Confervaceæ, placed by Ehrenberg under his Infusoria, but which Siebold, Williamson, Busk, and Cohn have shown to be confervoid Algæ. Nearly microscopic plants, composed of many zoospore-like bodies associated into spherical or quadrangular colonies, the separate members of which, connected or held together in various ways by cell membranes, retain their distinct individuality for all purposes of nutrition, growth, and reproduction. They are inhabitants of freshwater ponds, in which the whole colony is carried in a circular and progressive movement by the vibratile motion of the cilia, which project from the separate individuals through the jelly into the water. They exhibit in their maturity the characters of the transitory zoospores of other confervoids.

Within the sac are various dense globules, generally green in summer, but often of an orange-colour in autumn and early winter. They are zoospore-like bodies, each sending a pair of cilia through separate orifices. There is a reddish-brown spot and a contractile vacuole. Found abundantly in clear pools on open commons and similar localities.

C. *As substantive:*

1. The act of ejecting the contents of the stomach by the mouth.

¶ Vomiting is generally preceded by feelings of nausea, during which there is a copious flow of saliva into the mouth. This being swallowed carries down with it a certain quantity of air, which, assisting in the opening of the cardiac sphincter, facilitates the discharge of the contents of the stomach. There generally follows ineffectual retching, during which there is a deep inspiration, by which the diaphragm is thrust down as low as possible against the stomach, the lower ribs being at the same time drawn in. Then there is a sudden expiratory contraction of the abdominal walls, so that the stomach is compressed without, and its contents sent up the œsophagus. The primary origin of vomiting may be gastric or cerebral.

vor′-tĕx (pl. **vor′-tĭ-cēs, vor′-tĕx-ĕs**), *s.* [Lat. *vortex*, *vertex*, from *verto* = to turn.]

Physics: The form assumed when any portion of a fluid is set rotating on an axis; a whirling or circular motion of any fluid, either of water or air, forming a kind of cavity in the centre of the circle, and in some instances drawing up the water or absorbing other things. Eddies, whirlpools, waterspouts, whirlwinds, &c., are familiar examples.

* ¶ *Descartes's vortices:*

Astron. & Physics: An hypothesis proposed by René Descartes (A.D. 1596–1650) to account for the movements of the heavenly bodies. He supposed space filled with fluid matter, and that each fixed star or planet exerted some

influence on the matter for a certain distance round itself; this space he called its "heaven." The sun's heaven was moved around it after the manner of a vortex or whirlpool, carrying with it the planets, around which their heavens moved as minor vortices. Newton controverted the Cartesian view, which long retarded the acceptance of the gravitation theory in Europe.

vortex-atom, *s.*

Physics: A name sometimes given to the ultimate parts of matter which, on the Vortex-theory of Sir W. Thomson, may be inconceivably small vortices in the ether.

vortex-ring, *s.*

Physics: A vortical molecular filament or column returning into itself so as to form a ring composed of a number of small rotating circles placed side by side. All such rings have two motions: a motion of translation, and a vortical motion; but the vortical motion of the inner portions of the ring appears to coincide with the motion of translation, whilst that of the outer portions is in a contrary direction to it. Vortex-rings may be made in a glass of water by dropping milk or ink into it, but the rings are so small that the only motion perceptible is that which carries them to the bottom of the glass. The simplest method of showing vortex-rings in air is to take an ordinary match-box and make a small round hole in one end; in the inner portion of the box put a little dry tobacco, light it, and close the box. By giving the end of the box opposite the hole a smart tap with the finger, tiny smoke-rings will issue from the orifice. It should be borne in mind that the smoke has nothing to do with the vortex, which is in the air—the smoke only renders it visible.

vōt'-ĭng, *pr. par.* or *a.* [Vote, *v.*] Voting in past times was largely performed openly, in many instances by acclamation of an assembled people. In ancient Greece voting was either by show of hands or by ballot—the latter intended for secrecy; the ballot being a white or black ball dropped secretly into a box, or a marked potsherd similarly deposited. It was not until 1872 that the secret ballot at parliamentary and municipal elections was adopted in England. In the New England States the practice of secret voting has always been in vogue, and it has long been practiced throughout the United States, while it has become common in most other countries. As the secrecy of the ballot, however, was evaded by several partisan devices, a new ballot system, permitting complete secrecy recently devised in Australia, has been made the law in many states of the Union, and in some other countries. In this system, in its most common form, the names of all candidates are printed on a single sheet, and are voted for by making a cross at the head of a party list, if the voter favors the whole ticket, or opposite each name, if he desires to divide his vote among the party candidates.

II. *Eccles. & Church Hist.:* A special promise made to God to do or forego something for the promotion of his glory. The subject-matter must always consist of "a greater good," in ecclesiastical language "de bono meliori." The practice of making vows appears in the religious history of all races in any degree civilized. It entered largely into the Mosaic Dispensation (Gen. xxviii. 20–22; Lev. xvii. 2; Num. xxx. 2, &c.). In Deut. xxiii. 21, the necessity of fulfilling a vow is insisted on (cf. Eccles. v. 4, 5), but in the following verse it is pointed out that there is no sin in forbearing to make a vow. The practice continued among the Jews in New Testament times (Acts xviii. 18). With the rise of monachism (q.v.), vows to observe the evangelical councils of voluntary poverty, perpetual chastity, and entire obedience, became common and prevailed in the Church till the Reformation, when the Reformers taught that, since it was the duty of every man to devote himself and all his possessions to the service of God, vows were unnecessary. Vows, however, still enter largely into the religious system of the Roman Church. To the three vows (poverty, chastity, and obedience) taken by all religious [Religious, B.], a fourth, that of stability (= remaining in the order) is sometimes added. In addition to these there are private vows—of chastity, pilgrimage, &c. Vows are of two kinds: simple and solemn, the difference between them being that the latter are instituted as such, and accepted as irrevocable by the Church, and they constitute one of the marks of a religious order as distinguished from a congregation [Order, *s.*, ¶ (9)]. Simple and solemn vows differ also in their effects. A simple vow makes marriage unlawful, and deprives the person who has made it of a right to use any property he may possess; a solemn vow makes marriage invalid, and takes away all dominion over property. Solemn and certain simple vows, as those of chastity and of greater pilgrimage, can only be dispensed by the Pope, or by a superior specially delegated for the purpose; but most of the simple vows can be dispensed by the bishop of the diocese in which the person who has made the vow resides.

A. *As substantive:*

1. A sound that is uttered by simply opening the mouth or vocal organs; a sound produced by the vibration of the vocal chords. The pitch or tone of a vowel is determined by the vocal chords, but its quality depends upon the configuration of the mouth or buccal tube *A*, *i*, and *u* are by philologists called the primitive vowels, and from them all the various vowel sounds in the Aryan languages have been developed. A vowel differs from a consonant in that the former can be pronounced by itself, while a consonant requires the aid of a vowel to be sounded with it. While there are only five vowels, *i.e.*, characters representing such sounds, there are fourteen vowel and five diphthongal sounds in English.

"For the formation of the three principal *vowels* we give the interior of the mouth two extreme positions. In one we round the lips and draw down the tongue, so that the cavity of the mouth assumes the shape of a bottle without a neck, and we pronounce *u*. In the other we narrow the lips and draw up the tongue as high as possible, so that the buccal tube represents a bottle with a very wide neck, and we pronounce *i* (as in French and German). If the lips are wide open, and the tongue lies flat and in its natural position, we pronounce *a*. Between these three elementary articulations there is an indefinite variety of vowel sounds."—*Morris: Hist. Outlines of English Accidence*, § 47.

2. A letter or character representing such a sound.

¶ One of the most remarkable voyages of antiquity was that of Solomon and Hiram's navigators to India, or some place to which its productions were brought. The names of the apes, peacocks, &c., obtained are Malabar words, which suggests that South-Western India itself was visited. An exploring expedition sent out by Pharaoh Necho about 604 B.C. is said to have sailed round Africa. The Periplus of Hanno the Carthaginian, B.C. 400, was also a great nautical exploit. The discovery of America by Columbus 1492, and the passage of the Cape of Good Hope by Vasco de Gama, with his ultimate arrival in India (A.D. 1497), constitute two of the greatest nautical enterprises of modern times. After these rank the expeditions which circumnavigated the globe [Circumnavigator] and those for the discovery of the North-East and North-West passages. [North-East, ¶; North-West, ¶.]

He was the son of Jupiter, who, incensed at his interference on the part of his mother, Juno, cast him out of heaven; he fell in the isle of Lemnos, and broke his leg in the fall. He was the patron of armourers and workers in metal. There is about the character of Vulcan much of the usual confusion belonging to Greek mythology. Cicero mentions three Vulcans, besides the son of Jupiter; one, the child of Uranus; another, of Nilus, who reigned in Egypt; a third of Mænalius. A peculiarity attending the worship of Vulcan was, that the victims were wholly consumed, in reference to his character as god of fire. In sculpture he is represented as bearded, with a hammer and pincers, and a pointed cap. He had under him, as workmen, the Cyclopes, whose workshop was on Mount Etna, where thunderbolts were forged. He is identified with the Greek Hephæstos.

***2.** *Astron.:* The name given to a planet, imaginary or real, between the Sun and Mercury. On March 26, 1859, M. Lescarbault, a village physician of Orgères, Eure-et-Loire, France, saw or fancied that he saw a small dark planet-like body pass across the sun's disc. In September the alleged discovery reached Leverrier, who eagerly grasped it, as he had previously come to the conclusion that the motions of Mercury were affected by the perturbation of a planet between it and the sun. He even went so far as hypothetically to calculate the elements of the new planet. M. Liais stated that he was examining the sun at the very moment of M. Lescarbault's supposed discovery, and was certain that no dark body passed across the disc. The planet was called by anticipation Vulcan, but its existence still remains unconfirmed. It is of a brownish-black colour, is hard and tough, cuts easily, is susceptible of a good polish, and is not affected by water or any of the other caoutchouc solvents. The substance thus formed is elastic at all temperatures, cannot be dissolved by the ordinary solvents, and resists the effects of heat within a considerable range of temperature. Vulcanized india-rubber is largely used for many useful purposes, as for waterproofing cloth, for boots, shoes, mats, toys, belting, buffers, wheel-tires, washers, valves, pipes, fire-hose, medical and surgical appliances, &c. Biblical Versions: The most celebrated and most widely diffused version of the Bible into the Latin language. It is believed to have been made by St. Jerome, who was born in Dalmatia A.D. 329 and died at Bethlehem A.D. 420. The early Church seems for a considerable time to have consisted mainly of members who spoke Greek, and the necessity for a Latin version of the Scriptures was first felt in Northern Africa. One or more Latin translations were made in that quarter, which after a time were superseded by the Italic Version (q.v.). In 383 Pope Damasus urged Jerome to revise the Latin version of the New Testament by the Greek original. Undertaking the work, he found innumerable false readings, interpolations, and corruptions, and though he acted cautiously to avoid alarming the ignorant and the timid, his version was a great advance on its predecessors. He next revised the Latin version of the Old Testament by the aid of the Greek Septuagint. Finally acquiring the Hebrew tongue after he was forty-five years of age, he translated the Old Testament directly from the original language. Although his version had at first to encounter the hostile clamours of the ignorant, it made way by its own merits, without much assistance from authority, through the whole Latin-speaking portion of ancient Christendom. Gradually, however, the text was corrupted, and recensions became needful. One was commenced A.D. about 802 by Alcuin at the instance of Charlemagne, a second by Lanfranc, Archbishop of Canterbury, A.D. about 1089, and there were others. The invention of printing led to the immediate issue about 1455 of the Mazarin Vulgate, printed at Mainz by Gutenberg and Fust, others following at intervals. In 1546 a commission appointed by the Council of Trent reported that the text of the Vulgate was very corrupt. In 1587 an edition of the Vulgate appeared, the proof-sheets of which were partly corrected by Pope Sixtus V., who used his authority to procure acceptance for the work. But further study showed that many of the attempted emendations were erroneous, and there was a further revision by Toletus under the auspices of Pope Clement VIII. It was issued in 1592, and is the authorised edition in the Roman Church. It bears the name of both pontiffs, being entitled "Biblia Sacra Latina Vulgatæ editionis Sixti V. et Clementis VIII." Wycliffe's version of the Bible was made from the Vulgate; and thus that version has affected the Authorised version, as it has those published in the languages of Western Europe. A large number of the theological terms now in use, such as "sacrament," "justification," &c., have been adopted from the Latin of the Vulgate.

"The Latin Church found in the *Vulgate* an instrument for reaching all hearts and guiding all tongues."—*J. S. Brewer: English Studies*, p. 345.

¶ Hence sometimes applied to the ordinary text of any author.

"Let us pass from 'The Tempest' to the 'Comedy of Errors,' v. ii., 'My heavy burden are delivered.' So the folio, and rightly. The *vulgate* gives 'burdens,' reduplicating the plural."—*Notes & Queries*, May 19, 1888, p. 382.

vŭl'-ture, *s.* [Lat. *vultur* = a vulture, lit. = a plucker or tearer, from the same root as *vello* (pa. t. *vulsi*) = to pluck, to tear.]

1. *Lit. & Ornith.:* A popular name for any species of the Vulturidæ (q.v.). They are large birds of repulsive habits and appearance, but extremely useful, since they perform the office of scavengers in the warm countries which they inhabit. They feed on the ground, where they walk with comparative ease, their large feet being well fitted for progression. Unlike eagles, they do not carry food to their young, but devour the carrion and feed their nestlings by regurgitating food from their crop. It has long been a vexed question as to whether they discover their prey by sight or by smell, and experiments show that they possess both senses in an extraordinary degree, but the balance of evidence goes to prove that they generally find their food by sight. The chief species are: The Black Vulture (*Vultur monachus*), the Griffon or Fulvous Vulture (*Gyps fulvus*), the Sociable or Eared Vulture *Otogyps auricularis*), the Nubian Vulture (*O. nubicus*), the Egyptian Vulture (*Neophron percnopterus*), and the King Vulture (*Sarcorhamphus papa*). The Condor (*S. gryphus*) of South America is the greatest of the vultures. In the United States the family is represented by the well-known and common Turkey Vulture, or Turkey Buzzard (*Chatartes aura*).

W.

W, the twenty-third letter of the English alphabet. It takes its form and its name from the union of two V's, the character V having formerly the name and force of U. [U, V.] The name "double u" is not, however, a very suitable one, being given to the letter from its form or composition, and not from its sound. In the Anglo-Saxon alphabet W had a distinctive character of its own, the modern letter being adopted in the thirteenth century. W represents two sounds: (1) the distinctive sound properly belonging to it, being that which it has at the beginning of a syllable, and when followed by a vowel, as in *was, will, woe, forward, housework*, &c.; (2) at the end of syllables, in which position it is always preceded by a vowel, it has either no force at all (or at most only serves to lengthen the vowel), as in *law, paw, grow, lawful*, &c., or it forms the second element in a diphthong, as in *few, new, now, vow*, &c., being in such cases really a vowel, and equivalent to the *u* in *bough, neutral*, &c. It is formed by opening the mouth with a close, circular configuration of the lips, the organs having exactly the same position as they have in pronouncing the *oo* in *foot.* W is hence often spoken of as a vowel; but it is not so, as may be seen by comparing *woo, wood*, and *woman*, in which *w* is not equivalent to *oo.* W is now silent in many words and positions: (1) in words, as in *gunwale, boatswain, answer, sword, two, twopence*, &c.; (2) when initial and followed by *r*, as in *wrap, write, wrong*, &c. (It is, however, still sounded in this position in Scotland.) The initial *wh*, in Anglo-Saxon, *hw*, as in *who* (A.S. *hwa*), *whelp* (A.S. *hwelp*), had originally a guttural sound, as seen in the Scotch *quhat* = what, *quhan* = when, &c. It represents the cognate Icelandic *hv*, and Latin initial *qu.* In Scotland, at the present day, a very decided guttural sound is heard in such words as *what, whale*, &c., and in Aberdeen the guttural has become *f*, as in *fat* = what. In English pronunciation, in initial *wh*, the *w* is silent in *who, whom*; in other words it is generally pronounced with a slight aspiration after it, as in *when, what, which*, though there is often a tendency to suppress the *h* and pronounce *w* pure and simple. The Anglo-Saxon initial sound *wl* has become simple *l*, as in *lisp*; A.S. *wlisp.* W has disappeared

from some words, as from *ooze* = A.S. *wós*; *four* = A.S. *feower*; *tree* = A.S. *treow*; *knee* = A.S. *kneow*. It has crept into *whole* and its derivatives = A.S. *hal, hol:* so *whoop* = Fr. *huper*. It has disappeared from the combinations, *tw, thw,* and *sw,* as *tush* = A.S. *twisc*; *thong* = A.S. *thwang*; *sister* = A.S. *swister, swuster*; *such* = A.S. *swilc*. It represents *v* in *periwinkle* = Fr. *pervenche*, Lat. *perivinca*; and *g* in *law* = A.S. *lagu*; *saw* = A.S. *sage*; *dawn* = A.S. *dugian*; *marrow* = A.S. *mearg*, &c.; so *wafer* = O. Fr. *gauffre, goffre*, Lat. *gafrum*. Coming before an *a*, the *w* often gives the vowel an *o* sound, as in *wad, wallow*, &c.

W. As an initial, is used for West, as in charts: W.S.W. = West-South-West, &c.

W. As a symbol, is used:

In chem.: For the element Tungsten (Wolfram).

***wāg' ĕr ĕr,** *s.* One who wagers or bets.

wāg' ĕr ĭng, *pr. par.* or *a.* [Wager, *v.*]

wagering policy, *s.* [Policy (2), *s.*, ¶.]

wāg' ĕs, *s. pl.* [Wage, *s.*] The payment for work done or services performed; the price paid for labor; the return made or compensation paid to those employed to perform any kind of labor or service for their employers.

¶ Some economists have held that the rate of wages is determined by the ratio which the capital—for the productive use of which labor is sought—bears to the number of laborers seeking that kind of employment; that when the capital increases more rapidly than the laboring population of a country, wages rise; when it increases more slowly, they fall. It has also been noted that the effect of a rise in wages is to produce an increase in the number of marriages and, in due time, of population with the result of ultimately causing wages again to fall. A simpler theory is that labor is really a sort of commodity, and subject to the laws of commodity, which are immutable (*vide infra*). This view will account for the fact that all attempts to fix wages by law have proved inoperative and mischievous, a conspicuous example being the effort made, in the reign of Edward III. (1360), on the part of capitalists, after the Black Death (in 1349) had swept away so large a part of the population, both in Britain and on the continent, that wages naturally and greatly rose. In the United States it has been considered highly desirable to preserve American mechanics from open competition with the poorly paid labor of Europe, and the protectionists claim that the American tariff system furnishes such protection to American labor. However true this may be, the fact remains that this system has not prevented frequent and extensive strikes proceeding from the reduction of wages; and the question of the relations of capital and labor is still one of vital significance in American economics.

"The produce of labor constitutes the natural recompense or *wages* of labor."—*Adam Smith: Wealth of Nations*, bk. i., chap. viii.

Practically, however, labor is treated as a commodity, and, therefore, the price of labor (wages) is subject to the influence of the natural law of commodity affecting the supply of and the demand for laborers; and if, through low wages, capital (which is an employing agent but not a productive factor in economics) shall absorb an undue proportion of "the produce of labor," Mr. Smith's idea of "natural recompense" must prove inoperative. It seems clear that our recurrent labor troubles may be ascribed to this cause, at least in part. [See Capital, *s.*, B. 3. ¶.]

¶ Although a plural, *wages* sometimes has the verb in the singular.

"The *wages* of sin is death."—*Romans* vi. 23.

¶ Strictly speaking, the term *wages* comprehends as well the *pay* of officers, the *fees* of lawyers, medical men, &c., the *salary* of clerks, the *stipends* of clergymen, as the remuneration for mechanical and menial labor.

1. A four-wheeled vehicle for the transport of goods, freight, and produce. The ordinary goods wagon is a strong, heavy vehicle, drawn by two horses yoked abreast. The fore-wheels are smaller than the hind-wheels, and their axle is swivelled to the body of the vehicle, so as to facilitate turning. Most wagons are supplied with strong springs on account of the weight of the vehicle, and to make up for the absence of the steadying power of the horses, who expend their force in pulling only, the weight being distributed over the four wheels. A vehicle on four wheels of equal diameter is of lighter draught than one in which the fore-wheels are smaller than the hind-wheels, unless the load is distributed on the wheels in proportion to their diameter. Wagons are used for many purposes, agricultural and commercial. Those used to carry goods needing protection from rain are provided with wooden bows, over which is stretched a covering of heavy canvas or other material. The ends of the bows are inserted in staples on each side of the vehicle, so that cover and bows can be removed when not required.

Wa-ha'-bî, Wa-ha'-beē, *s.* [Named after Abdul-Wahhab = the servant of Him who gives everything.]
Muhammadanism (Pl.): A sect founded by Abdul Wahhab, born towards the end of the seventeenth century, near Der'aiyeh, the capital of Nejd, in Arabia. During the Saracen period the Muhammadan sacred places were in Arab custody. When the Saracen was succeeded by the Turkish power they passed over into Turkish keeping. It is obligatory on every Musalman who can afford the expense, to make a pilgrimage to Mecca at least once in his life. The Arabs were greatly scandalized by the moral laxity of some of the pilgrims, and it became painfully apparent that even the best of them had largely departed from the purity of the faith, according divine honours to Muhammad, elevating tradition to the same level as revealed scripture, and quietly ignoring any precept of the Koran which required self-denial for its performance. Abdul Wahhab felt it a duty to make a determined effort to restore Muhammadanism to its pristine purity, and the most earnest Moslems gradually became his followers. Converting to his views Muhammad Ibu Saud, the powerful Sheikh of Der'aiyeh, whose daughter he married, he induced his father-in-law to draw the sword for the establishment of a pure Muhammadan theocracy. The Bedouins flocked to his standard; the towns of Arabia, less inclined to adopt the new faith, had to be conquered. The Pasha of Bagdad, A.D. 1748 and 1749, somewhat retarded, but did not permanently arrest their progress. In A.D. 1765 (1172 of the Hegira), the father-in-law died, and on June 14, 1787 (A. H. 1206), the revivalist or reformer. The former was succeeded by his son, Abdul-Aziz. In 1797 the Wahabees pillaged the town and tomb of Husein; in 1803 they captured Mecca, and in 1804 Medina, where they plundered the tomb of Muhammad himself. By this time Abdul-Aziz had been succeeded by his son Saud, by whose orders the Khootba (public prayer) was no longer allowed to be offered in the name of the Sultan. With the exception of the territory subject to the Imam of Muscat, all Arabia now submitted to the Wahabees. They also captured some Arabic towns on the coast of Persia, and Wahabee pirates infested the Persian Gulf. In 1809 these pirates were severely punished by the British, in conjunction with the Imam of Muscat. The same year Mehemet Ali, Pasha of Egypt, prepared to attack them. In 1812 he took Medina, and in 1813 Mecca. In 1816 Ibrahim Pasha, the son of Mehemet Ali, assumed the command of the Egyptian troops, and, entering Arabia, took Der'aiyeh in 1818, and capturing Abdullah, son and successor of Saud, sent him to Constantinople, where he was beheaded. In 1827, 1834, 1838, and 1839 the Wahabees attempted to excite insurrections, and required continual vigilance from Egypt. In 1862 and 1863 Palgrave found them numerous in Arabia. The Wahabee movement is not now confined to Arabia; it has spread throughout the Muhammadan world, and though quiescent at present, still possesses vigorous life, and will doubtless again from time to time break forth. Many adherents of the sect are believed to exist in India, Patna being considered one of their strongholds.

As a plural, the word was sometimes used to describe those who acted as the town musicians, but who did not do duty as watchmen, and any company of performers when employed as serenaders. The instruments used were a species of hautboys, called also shawms, and from their use "waits."

Each church on its consecration was dedicated to some particular saint, and when the anniversary of the day of consecration came round, the parish wake was held; and in many parishes a second wake was held on the birthday of the saint. Tents were erected in the churchyard to supply refreshments to the crowd on the morrow, which was kept as a public holiday. The original motive of devotion and reverence was soon lost at these meetings, which degenerated into mere fairs or markets, characterized by merry-making, and often disgraced by riot and dissipation; hence the term came to mean merry-making generally; a festive gathering.

With a clean strength that cracks a cudgell well,

3. The watching of a dead body prior to burial by the friends and neighbours of the deceased. Such a custom was formerly prevalent in Scotland, and is still common in Ireland. Though professedly held for the indulgence of reverential sorrow, wakes are too often converted into drunken and riotous orgies.

Wal dẻn' sęs, Val dẻn' sęs, *s. pl.* [Named From Peter Waldo, their alleged founder, born at Vaux (Lat. *Waldum*) on the Rhone, early in the twelfth century.]

Church Hist.: A sect which for many centuries has maintained its independence of the Church of Rome, from which it differs in tenets and government. Its chief seats have long been in the three high valleys of Piedmont, situated in the Cottian Alps, on the Italian side of the main chain, but so near the great pass between France and Italy, that French as well as Italian is spoken in the valleys. They claim to have arisen in apostolic times, maintaining an unbroken succession of bishops, but the claim is unfounded, and they probably derived their origin from Peter Waldo [see etym.], a rich merchant of Lyons, and deeply pious man, who at first had no desire to depart from the tenets of the Roman Church, but simply aimed at deepening the religious feeling of its adherents. He was ultimately brought into collision with the Church authorities when, in and after 1160, he had the four gospels translated from Latin into French, and adopted the view that it was lawful for laymen to preach. His opinions spread rapidly; his followers, like himself, not at first greatly differing in doctrine from the Church of Rome. According to Comba (*Hist. de Vaudois d'Italie*) they had no distinctive Waldensian literature, nor any wide religious influence, until after they had been influenced by the teaching of Wycliffe and his disciple Hus. [Hist. [illegible] M. Monod (*Ch. Hist. Lit.* [illegible]) divides Waldensian literature into three periods: (1) The Catholic period, during which the dogmas and practices of the Church were accepted. (2) The Hussite period, in which the Pope is fiercely attacked, the Sacraments are invalid by reason of the wickedness of the priests, and there is a strong leaning towards the Universal Priesthood. (3) The Calvinistic period, marked by falsification of documents, forgery, and mutilation, with the object of showing that the Waldensian is a Christian body which had descended from Apostolic times, preserving their faith (through the ages in primitive form. This fiction M. Monod has destroyed, though, as he acknowledges, the late Mr. Henry Bradshaw had already exposed the real character of some of the documents adduced. After the Reformation, persecution, which had already been directed against them became more fierce. Numbers were slain by Francis I., of France, in 1545 and 1546, by the Duke of Savoy in 1560, and by Charles Emmanuel II. in 1655. Other persecutions followed in 1663, 1664, and 1680, great sympathy for the sufferers being shown by Protestant nations, especially by England during the Protectorate. Gradually the Waldensians obtained toleration; on December 15, 1853, they received permission from Victor Emmanuel II. to erect a church in Turin, and it is probable that they will unite with the Free Church of Italy. The services are of the plainest type of Genevan Protestantism, the people only joining in the occasional sing[illegible] [illegible]

¶ *Walker!* or *Hookey Walker!* A slang exclamation of incredulity, when a story is told or a statement made which is known or believed to be false. The origin of the expression is much disputed, and was discussed at length in *Notes & Queries*. There are three explanations of the phrase : (1) That many years ago there was an aquiline-nosed Jew named Walker, a popular lecturer on astronomy, who, telescope in hand, invited his pupils to "take a sight" at the moon and stars. The phrase struck his schoolboy auditory, who frequently "took a sight" with the gesture of outstretched arm and adjustment to nose and eye. (2) That Hookey Walker was a London magistrate of dreaded acuteness and incredulity, whose hooked nose gave the title of "beak" to all his successors. (3) that John Walker was an out-door clerk in a business house in Cheapside. "Old Jack," who had a hooked nose, was a spy upon the employés, who were always throwing discredit on his reports, so that in time his word was disbelieved and his occupation ceased. (*Slang Dict.*)

A. *As substantive :*

1. *Bot.* : Any species or tree of the genus Juglans. There are seven or eight species in all, the best known being the Black Walnut (*Juglans nigra*) of the United States, and the Common Walnut (*J. regia*), a native of Asia. The Black Walnut is a large and beautiful tree, its trunk being sometimes six or seven feet in diameter, while its timber is of the highest value for cabinet manufacture. The fruit is inferior to that of *J. regia*. Another common species of this country is the Butternut (*J. cinerea*), a much smaller tree, which bears an elongated nut, covered with a viscid substance. Sugar is obtained from the sap of this tree, as from that of the maple. The inner bark is mildly cathartic. The leaves, rubbed to powder, are useful for blistering. *J. regia* is a large tree, which bears an excellent fruit, and has long been cultivated in Europe. It has been introduced into this country, and is highly valued for its wood, which was held to be the best known till mahogany was discovered, and is still exceedingly prized for gunstocks, though it is now imported into Europe for this purpose from Asia.

2. *Comm.* : The wood of the walnut-tree ; it is of great value as a cabinet and furniture material, being very durable, and taking a fine polish.

B. *As adj.* : Made of the wood of the walnut-tree : as, a *walnut* table.

walnut oil, *s.* The oil obtained from the albumen of the seed of the walnut tree by reducing them to a pulp, and subjecting them to pressure, first with and then without heat. In Cashmere the oil is largely used in cookery and as an illuminant, but in Europe it is not much employed for food, the taste being offensive to many persons.

Min. : A triclinic mineral, occurring in thin, scale-like crystals, with various other uranium compounds, at the Weisser Hirsch mine, near Schneeberg, Saxony. Sp. gr. 5·8 ; lustre, somewhat adamantine to greasy ; colour, wax-yellow. Compos. : a hydrated arseniate of bismuth and uranium, with the suggested formula $4R_2O_3AsO_5 + 5HO$, in which R_2O_3 = the oxides of bismuth and uranium.

Wàl pûrg' is (W as V), *s.* [See compound.]

Walpúrgis night, *s.* The eve of May 1, which has become associated with some of the most popular witch superstitions of Germany, though its connection with Walpurgis, Walpurga, or Walburga, a female saint of the eighth century, is not satisfactorily accounted for, her feast falling properly on Feb. 25. On this night the witches were supposed to ride on broomsticks and he-goats to some appointed rendezvous, such as the highest point of the Hartz Mountains or the Brocken, where they held high festival with their master, the devil.

wàl'-rŭs, *s.* [Orig. from Scandinavian ; cogn. with Sw. *vallross* ; Dan. *hvalros* ; Icel. (in an inverted form) *hross-hvalr* = a horse-whale, the name being given (it is suggested) from the noise made by the animal sometimes resembling a neigh ; A.S. *hors-hwæl* = horse-whale, a walrus. (*Skeat.*)]

Zool. : *Trichechus rosmarus* ; called also the Morse, Sea-horse, and Sea-cow. The Walrus is now confined to the regions within the Arctic Circle, though its extinct ancestors had a much wider geographical range. It is a large carnivorous marine mammal, ordinarily from ten to twelve feet long, with a girth of nearly as much ; "it is said that it sometimes attains a length of twenty feet" (*Van Hoeven*) ; muzzle abruptly truncated, with long and remarkably strong bristly moustaches ; small eyes ; external ear wanting, though the orifice is distinctly visible ; body large and sack-like, tapering towards the tail ; hind limbs short, connected by a membrane which covers the

tail, fore limbs strong and stumpy, all with five digits. The hide is of a tawny-brown colour, with difficulty penetrated by bullets, and has been likened to a tough, flexible coat of mail. The upper canines are developed in adults of both sexes into immense tusks, each from fifteen inches to two feet long, and weighing ten pounds and upwards. In some individuals the points converge towards and in others they diverge from each other. This was one reason why Fremery wished to adopt two species; but Sundevall has shown that scarcely two skulls can be examined without minute differences in the size and direction of the tusks being perceived. The most important function of these tusks is digging shell-fish, the favourite food of the Walrus, out of the banks and mud of shoal-water. They are also employed to raise the body out of the water, by digging them into ice-floes, which probably gave rise to the legend of the Rosmarine (q.v.); and they form terrible weapons of offence, as by a quick turn of the neck the animal can strike upwards, downwards, or sideways with equal dexterity. Walruses are gregarious, and are found on the sea-shore and on ice-floes; some keep guard whilst those of the main body sleep, and when danger threatens the sentinels awake the others by bellowing. They are said to be monogamous, and the female brings forth at nine months one calf, usually on the ice-floes. In disposition they are quiet and inoffensive, unless attacked or during the love-season, or if their young are in danger, when they become desperately aggressive, and furiously attack the hunters on the ice or in their boats. The area of the Walrus and its numbers, owing to reckless slaughter by sealers and whalers, are fast decreasing, and the few remaining seek unfrequented spots in high latitudes inaccessible to sealers. At one time there was a considerable trade in Walrus-hunting, but it is now at a very low ebb: the tusks alone have any commercial value at the present time; but formerly Walrus-hides were used for various purposes, such as machine-bands, &c. A living specimen was brought alive to Holland in 1612; and two specimens have been procured for the Zoological Gardens, Regent's Park, London, but both died soon after being brought to their new quarters.

Music:

1. A dance said to have originated in Bohemia, now of almost universal adoption. It is performed by couples, who, almost embracing each other, swing round the room with a whirling motion. It was introduced into England in 1813.

2. The music composed for such a dance. The time is of triple measure in crotchets or quavers, and consists of eight or sixteen bar phrases. Modern waltz-writers frequently add to the original dance-form an introduction and coda. The "Vienna" waltz is characterized by a rapid movement and strict unbroken time. Ländler are slower and more dignified than the waltz. "Classical waltzes" are compositions in waltz-form intended for set pieces, not for dance tunes. In them greater scope is given to the composer and performer than is compatible with the rhythm of the dance.

Another legend is that Jesus, pressed down with the weight of his cross, stopped to rest at the door of one Ahasuerus, a cobbler. The craftsman pushed him away, saying, "Get off! Away with you, away!" Our Lord replied, "Truly I go away, and that quickly, but tarry thou till I come." A third legend says that it was the cobbler who haled Jesus before the judgment seat of Pilate, saying to him, "Faster, Jesus, faster!" The legend has formed the basis of many poems and novels.

Dan. *werre* = war, hostility, from *werren*, *verwerren* = to embroil, to bring into disorder or confusion; Dut. *war* = entanglement, confusion; *warren* = to disturb, to embroil.]

1. A contest between nations and states (International War), or between parties in the same state (Civil War), carried on by force of arms, and resorted to either for purposes of advantage or of revenge. The one party possesses, or takes possession of something which the other has resolved to seize, or has inflicted some real or supposed injury on the other, which he determines to punish by the infliction of a corresponding chastisement. Formerly, war was waged at the will of despotic monarchs; now wars usually arise, in the first instance, from disputes concerning territorial possessions and frontiers, unjust dealings with the citizens of one state by another, questions of race and sentiment, jealousy of military prestige, or mere lust of conquest. Civil wars arise from the claims of rival competitors for the supreme power in a state, or for the establishment of some important point connected with civil or religious liberty. In all cases, the object of each contending party is to destroy the power of the other by defeating or dispersing his army or navy, by the occupation of some important part of his country, such as the capital, or principal administrative and commercial centres, or the ruin of his commerce, thus cutting off his sources of recuperation in men, money, and material. An international or public war can only be authorised by the sovereign power of the nations, and previous to the commencement of hostilities it is now usual for the state taking the initiative to issue a declaration of war, which usually takes the form of an explanatory manifesto addressed to neutral states. An aggressive or offensive war is one carried into the territory of a hitherto friendly power; and a defensive war is one carried on to resist such aggression. Certain laws, usages, or rights of war are recognised by international law. By such laws it is allowable to seize and destroy the persons or property of armed enemies, to stop up all their channels of traffic or supply, and to appropriate everything in an enemy's country necessary for the support or subsistence of the invading army. On the other hand, though an enemy may lawfully be starved into a surrender, wounding, except in battle, mutilation, and all cruel and wanton devastation, are contrary to the usages of war, as are also the bombarding of a defenceless town, firing on a hospital, the use of poison in any way, or torture to extort information from an enemy. [Succession, ¶ (7).]

"Upon the same principle also the sole prerogative of making *war* and peace is vested in the crown. For the right of making *war*, which by nature subsisted in every individual, is given up by all private persons that enter into society, and is vested in the sovereign power."—*Blackstone: Comment.*, bk. i., ch. 7.

1. *Lit. & Entom.:* Any species of the genus Vespa or of the family Vespidæ (q.v.) particularly the Common Wasp (*Vespa vulgaris*). It lives in a hole in the ground, generally about six inches beneath the surface, approached by a crooked entrance of about an inch in diameter. This passage leads to a subterranean room, in which is the vespiary made of gray paper or pasteboard in layers one above the other, and constituting a ball of thirteen or fourteen inches in diameter, and pierced with two round holes, through which the wasps come in and go out. The interior is occupied by horizontal tiers of combs, like floors in a house, supported by columns, and with passages between. Each cell is hexagonal, as in the combs of bees, but the material is paper. These tiers of cells are built in succession, the upper ones first. Sexually, wasps are of three kinds, males, females, and neuters, the two latter armed with an exceedingly venomous sting. The last are the workers in the hive; they also go out to bring in provisions for the community. Wasps are nearly omnivorous, feeding on honey, jam, fruit, butcher's meat, and any insects which they can overpower. A snare of these viands is given to the males and females, whose work lies more in the vespiary. The combs of a large nest may amount to fifteen or sixteen thousand. In these the females, which are few in number, deposit eggs, hatched in eight days into larvæ. These again go into the chrysalis state in twelve or fourteen days more, and in ten more are perfect insects. The males do no work. Most of the workers and all the males die at the approach of winter, and in the spring each surviving female, having been impregnated in autumn, looks out for a suitable place to form a new vespiary. A wasps' nest may be destroyed by burning sulphur inside the hole. The economy of the other social wasps is essentially the same, whether, like *Vespa holsatica* (*V. britannica*), they build a nest of paper in trees, or, like the foreign Polistes, place their combs in trees or bushes without a papery defence. The economy of the solitary wasps is essentially that of their type, Odynerus (q.v.), differing only in the material and locality of their nests, some building them of clay or agglutinated sand, and attaching them to or placing them in holes in walls, whilst a few burrow in sandy ground. The species popularly known as hornets and yellow-jackets have very severe stinging powers.

5. In the same sense as II. 1.

6. The period of time during which one person, or a body of persons, watch or stand sentinel, or the time from one relief of sentinels to another; hence, applied to a division of the night when the precautionary setting of a watch is more generally necessary. Amongst the Romans, the time from sunset to sunrise was divided into four equal spaces or watches, severally distinguished as first, second, third, and fourth watches, each containing three hours; but these hours varied in length, being longest in winter and shortest in summer, and the watch contained three of our hours only at the equinoxes. The Greeks also divided the night into four watches. The proper Jewish reckoning recognized only three of these watches, the first, from sunset till about 10 p.m., the second, or middle watch, from 10 p.m. to 2 a.m., and the third, or morning watch, from 2 a.m. to sunrise. After the establishment of the Roman power, the watches were increased in number to four, which were known as first, second, &c., or as even, midnight, cock-crowing, and morning, the watches terminating respectively at 9 p.m., midnight, 3 a.m., and 6 a.m. (Exodus xiv. 24, Judges vii. 19, Matthew xiv. 25, Mark xiii. 35.)

7. Any contrivance by which the progress of time is perceived and measured: as,

* (1) A candle marked out into sections, each of which denoted a certain portion of time in burning.

"Give me a *watch*." *Shakesp.: Richard III.*, v. 3.

(2) A time-keeper actuated by a spring, and capable of being carried on the person. The essential difference between a clock and a watch has been defined to be that the latter will run in any position, but the former in a vertical position only. Since the invention of the cheap spring-clock this definition must be abandoned. Another characteristic which was formerly distinguishing was that the watch escapement was always controlled by a balance-wheel and spring, while the clock escapement was generally governed by a pendulum. Watches are said to have been invented at Nuremberg, about the end of the fifteenth or beginning of the sixteenth century. The essential portions of a watch are the dial, on which the hours, minutes, and seconds are marked, the hands, which by their movement round the dial point out the time, the train of wheels, which carry round the hands, &c., the balance, which regulates the motion of the wheels, and the mainspring, whose elastic force produces the motion of the whole machinery. The works are inclosed in a case of metal, usually silver or gold. The shape is now universally circular and flat, so as to be easily carried in the pocket. The early watches had but one hand, and required winding twice a day. The spring was at first merely a straight piece of steel, not coiled. A spring to regulate the balance was first applied by Dr. Hooke, 1658; this was at first made straight, but soon improved by making it of spiral form. A repeating-watch, or repeater, has a small bell, gong, or other sounding object, on which the hours, half-hours, quarters, &c., are struck on the compression of a spring. The most perfect form of watch is the chronometer (q.v.).

* 8. The place where a watch is set or kept.

"I must to the *watch*."—*Shakesp.: Othello*, ii. 3.

II. *Technically:*

1. *Nautical:*

(1) The period of time occupied by each part of a ship's crew alternately while on duty. This period is one of four hours, the reckoning beginning at noon or midnight. But in order to prevent the constant falling of the same watch to the same portion of the crew, the time between 4 p.m. and 8 p.m. is divided into two short watches of two hours each, technically known as dog-watches. Thus, the watch from 12 noon to 4 p.m is the first afternoon watch; that from 4 p.m. to 6 p.m. the first dog-watch; and that from 6 p.m. to 8 p.m. the second dog-watch; from 8 p.m. to midnight is the first night watch; from midnight to 4 a.m. the middle watch; from 4 a.m. to 8 a.m. the morning watch; and from 8 a.m. to noon the forenoon watch. When this alternation of watches is kept up during the twenty-four hours, it is termed having watch and watch, in distinction from keeping all hands at work during one or more watches. An anchor-watch is a small watch composed of one or two men set to look after the ship while at anchor or in port.

(2) A certain portion of the officers and crew of a ship who together attend to working her for a certain period. [(1).] The crew of every ship while at sea is generally divided into two portions—the starboard-watch, which in the merchant service is the captain's watch, and is often commanded by the second mate; and the port-watch, which in the merchant service is commanded by the first mate. In the navy these watches are commanded by the lieutenants successively.

I. *Ordinary Language:*

1. A clear, colourless, transparent liquid, destitute of taste and smell, and possessing a neutral reaction. It is one of the most important and most widely-distributed substances in nature, occurring universally in one or other of its three physical states—liquid, solid, or gaseous. As a liquid it constitutes the great mass of the oceans, rivers, and lakes, which cover nearly three-fourths of the earth's surface; in the solid state it exists permanently in the form of ice or snow in the polar regions; and as a vapour is a constituent of the aërial envelope of the earth, and the exhalations of volcanoes and boiling springs. It occurs in combination in many mineral substances, and also in organic bodies, animals and plants containing from 80 to 90 per cent. Water is the most efficient of all solvents, there being few substances which are not, to some extent, affected by it, hence natural waters never occur absolutely pure, but contain in solution more or less of the constituents of the strata through which they have passed. Rain-water contains substances derived in minute quantities from the atmosphere, such as ammonia, nitrate of ammonia, carbonic acid, nitrous and sulphurous acids. Spring-water always contains a much larger proportion of dissolved substances than rain-water. When this is so highly charged with saline or gaseous constituents, as to have a peculiar taste or smell, and is untitted for ordinary use, it is called mineral-water (q.v.), and when the amount of these constituents do not sensibly affect its taste, &c., it is described as fresh-water. Sea-water is essentially a mineral water, its saline constituents consisting of the chlorides and sulphates of sodium, potassium, magnesium, and calcium, together with minute quantities of silica, bromine, iodine, phosphoric acid, &c. The total solid contents of sea-water in mid-ocean varies from 30 to 40 grms. per litre, being largest near the equator and smallest near the poles.

2. Water collected in a body, as the ocean, a sea, a lake, a river; any collection of water.

"The annihilating *waters* roar
Above what they have done."
Byron: Heaven & Earth, i. 3.

3. Water from the heavens; rain.

(2) Urine.

"Carry his *water* to the wise woman."
Shakesp.: Twelfth Night, iii. 4.

5. Applied to the colour or lustre of a diamond or pearl, and occasionally of other precious stones: as, a diamond of the first *water*—*i.e.*, one perfectly pure and transparent.

"The diamonds of a most proved *water*."
Shakesp.: Pericles, iii. 2.

II. *Technically:*

1. *Chem.:* H_2O. Water was long regarded as an element, but towards the end of the seventeenth century it was shown by Lavoisier to be a compound, and to consist of two parts by weight of hydrogen to sixteen of oxygen, or two volumes of hydrogen to one of oxygen. When pure it is free from taste and smell, and at ordinary pressure is liquid between 0° and

100°, boils at 100°, and freezes at 0°, expanding to the extent of one-eleventh of its volume. The quantity of heat absorbed in the melting of ice is sufficient to raise the temperature of an equal weight of water 79·2°, and the quantity of heat rendered latent by water at 100°, becoming vapour, would raise the temperature of water 5·37 times as much as from 0° to 100°. Water is 825 times heavier than air, and when converted into steam expands to nearly 1,600 volumes. One cubic centimetre at 4°, and under a pressure of 760 mm. of mercury, weighs 15·432349 grains, or one gramme, the unit of weight in the metric system.

2. *Comm.:* Stock issued without any provision being made for the payment of interest thereon.

"But it is said by the chairman of the Committee on Public Finance, that 'more than half of this stock is *water*, and could not have come into existence had not this business been superior to the control of competition.'"—*St. James's Gazette*, June 14, 1888.

3. *Geol.:* Water is one of the two most potent agencies in working geological changes on the earth's surface. In most cases it acts in direct antagonism to the other very potent cause, fire. Every river descending a mountain-slope, or crossing a plain, to reach the ocean carries with it, especially after heavy rain, abundant sediment, as does every tributary great or small. Much of this sediment reaches the sea, where, if the water be deep, it is lost for a time, while, if the water be shallow, it may gradually build up a delta, which an earthquake shock may convert into land fully reclaimed from the ocean. The boulders, gravel, &c., too heavy to be transported so far, are arranged according to their weight, the heaviest falling first. The expansion of water when it freezes in the crevices of rocks enables it in many cases to rend them asunder, and leave them of more manageable size to be transported. [AQUEOUS, B. 4.]

4. *Law:* Land is held to include water, but not water land. If the possession of a lake be disputed, the action must be brought, not for so many acres of water, but for so many acres of land covered with water.

water-analysis, *s.*

Chem.: The estimation of the dissolved contents of water under the three heads of gaseous, mineral, and organic matter, the latter including floating microcosms; but the term more generally refers, in the case of potable waters, to the determination of the organic matter and total mineral residue, without the separation of the latter into its constituent parts. No process of analysis does more than estimate the relative amount of organic matter; nor, excepting by the aid of the microscope, is any attempt made to differentiate between what is harmless and what is presumably hurtful. Wanklyn's method involves the estimation of the ammonia produced by boiling with permanganate of potash, and the amount of oxygen consumed as shown by the reduction of the permanganate. Frankland proceeds to determine the organic nitrogen and carbon, and from the results arrives at his conclusions respecting the purity of the water. Tidy allows the permanganate to react on the water at common temperatures, and determines the loss of permanganate at the end of one hour and three hours respectively. Whichever method is adopted, there are certain minimum limits below which a water is considered good, and above which it is regarded as either of doubtful quality or likely to prove injurious. The statement of the various limits and attendant circumstances connected with the source of the water supply, and which go to qualify the results obtained, are to be found described at length by the authors referred to in their published methods of analysis.

¶ A waterfall tends slowly to recede up the stream on which it exists. This retrogression is greatly aided when the strata consist of alternate hard and soft beds dipping up the stream. The running water and the spray soon scoop out the soft beds, leaving the harder ones without adequate support, and causing masses of them to fall from time to time. As the waterfall recedes, a gorge is left on the parts of the stream from which it has gradually moved back. The gorge below the falls of Niagara produced by the recession of the great cataract extends seven miles, and must, as Sir Charles Lyell has shown, have required some thousand years for its excavation. A similar gorge on the Rhine, from Bingen to Rolandseck, cut by a now departed waterfall, is sixty miles long. Just beneath the waterfall there is a hole like a "swallow-hole." It is often called a kettle. It has a spiral form, and may be four times as deep as wide, or of less proportion. It is excavated by an eddy carrying round pebbles.

wâ'-tĕr-spōut, *s.* [Eng. *water*, s., and *spout.*]

Meteor.: A remarkable phenomenon occurring for the most part at sea, but occasionally on land, though generally in this latter case in the neighbourhood of water. A waterspout at sea is usually formed in the following manner: a dense cloud projects from its centre a body of vapour, in form something like a sugar-loaf with the point downward. This cone is agitated by the wind until it assumes a spiral form, and gradually dips more and more towards the sea, where a second cone is formed having its point upward. The clouds above and the water below are violently agitated by the physical influences at work. Suddenly the descending and ascending cones of water or vapour meet in mid-air, and form one united pillar which moves onward vertically in calm weather, but obliquely to the horizon when acted on by the wind. The junction of the two cones is generally accompanied by an electric flash. After continuing in this form for a short time the waterspout bursts, in some cases with terrific violence, and to the destruction of anything in the vicinity. Many a ship has been overwhelmed in this manner, and sunk in a moment with all on board. In November, 1855, five vessels were destroyed by a waterspout in the harbour of Tunis. "Waterspouts on land" are phenomena of a different description, being merely heavy falls of rain of a very local character, usually known in the United States as cloudbursts. They are often destructive. On Aug. 30, 1878, the town of Miskolcz, in Hungary, was destroyed by one with considerable loss of life. These phenomena are, however, more common in India than in Europe. One which occurred at Dum-Dum, near Calcutta, was ascertained to be 1,500 feet in height, and it deluged half a square mile of territory to a depth of six inches. The cause of these phenomena has been assumed to be (1) electricity; (2) vortical motion; or (3) a combination of these causes. M. Weyher has, however, succeeded in producing them artificially, and his method shows that vortical motion is the great factor in the production of waterspouts. By means of a rotating tourniquet placed over cold water, an aërial eddy is caused which draws up the water, in the form of a spout composed of drops, to a considerable height; when the water is heated a clearly defined waterspout is seen. With from 1,500 to 2,000 rotations per minute, the vapour from heated water condenses into a visible sheath, enveloping a clearly-defined and rarefied nucleus, conical, and tapering downwards. As in natural marine spouts, water-drops are carried up and thrown out beyond the influence of the upward current.

* 4. A throng of people borne along together. (*Shakesp.: Cymbeline*, v. 3.)
5. A waving or undulating motion; a signal made by waving the hand, a flag, or the like.

II. *Physics:* An undulation; a movement which, though it seems progressive, is in reality only up and down, or, to a certain extent, to and fro, though it is transmitted to a distance by the fact that at each successive point the otherwise similar motion of a single particle takes place a little later in time = the time which it takes for the motion to be communicated from the preceding moving particle. Waves exist in water, in air (sound-waves), in ether (light-waves), &c. [SOUND, UNDULATORY-THEORY.] A wave upon the open ocean alternately rises into a ridge and sinks into a depression (the trough of the sea). Anything floating, say a quantity of sargasso sea-weed, rises on a billow and sinks again as the wave falls, without otherwise changing its place. Even the undulatory movement affects the water only to a few feet in depth, where, unless there are submarine currents, all is still. When a wave comes inshore and enters a narrow gulf, it becomes affected both by the return of the reflex waves from its sides and the friction of the bottom, if the water be shallow, so that instead of a movement mainly up and down, it now becomes progressive, and breaks in a series of billows on the sands or rocks. In the former case the water runs up the sand, and then recedes considerably before the next wave comes in. Sea waves are mainly caused by the wind. If a breeze blowing off the shore cause ripples near the land, these will rise higher the farther they are from the shore if the cause which brought them into being continues to operate. Out on the open ocean they rise to some feet in elevation, but it is a great exaggeration to call them "mountains high": they have, however, been witnessed approximately sixty feet from trough to summit in the Atlantic. When they rise into a sharp ridge, and the wind is strong, they crest over, break, and fall on the leeward side with abundant spray; but this does not occur on the ocean to the same extent as near shore. The force of waves is so great that, geologically viewed, they are a potent force in altering the conformation of coasts. When in a storm they break with transcendent force on a shore they scoop out soft shales into caves, allowing the harder rocks above in time to fall in, or they break off portions of those harder rocks themselves, besides grinding against each other any fallen slabs which may already be lying on the beach.

wave-offering, *s.*
Judaism: Heb. תְּנוּפָה (*tenuphah*) = agitation, tumult, a wave-offering, from נוּף (*nuph*) = to agitate, to wave. An offering which is believed by the Rabbis to have been waved to the four points of the compass, "before the Lord," as an acknowledgment of his sovereignty over the earth. It is often combined with the similar heave-offering, believed to have been waved upwards as an acknowledgment of his rule over heaven. It is connected also with the peace-offering, of which it, as a rule, constituted a part. When an animal was presented in sacrifice, the shoulder was often offered as a heave-offering and the breast as wave-offering. [WAVE-BREAST.] Both afterwards became the perquisites of the priests. On the second day of the Passover a sheaf was waved. At Pentecost two lambs of the first year were to be offered as a peace-offering, and both were to be waved, (Lev. x. 14, xxiii. 11–15, 20; Numb. vi. 20, xviii. 11.)

¶ As a proper name it is applied to a valley or tract of country lying between the north and south downs of Kent and Sussex.

Weald-clay, *s.*

English Geol.: The upper series of strata of the Wealden formation. It is about 1,000 feet thick, and, with the exception of its upper portion, which is fluvio-marine, is of freshwater origin. It constituted the delta of a great river, which, slowly subsided till at length the ocean was let in. The delta was inhabited by great Saurians, of the genera Iguanodon, Hypsilophodon, Pelorosaurus, Ornithopsis, and Hylæosaurus. These, becoming submerged as the delta sank, became imbedded, not in the Weald clay, but in the overlying Kentish Rag which succeeded the clay, and rests on it conformably. Throughout the clay itself are casts of Cyprides, and there are occasional bands of Sussex marble composed almost entirely of a species of Paludina. The Weald clay constitutes a valley between the elevated ridges of the Hastings Sand and the chalk downs of Kent, Surrey, Hampshire, and Sussex, from Hythe by Tunbridge, Hartingcombe, and Hailsham to Pevensey.

Wēald'-ęn, *a.* & *s.* [Eng. *weald; -en.*]

A. *As adj.:* Of or pertaining to a weald; specifically, pertaining to the weald of Kent and Sussex, or to the formation described under B.

B. *As substantive:*

English Geol.: A group of rocks consisting of clay, shale, sand, sandstones, grits, and limestones, constituting the lowest part of the Cretaceous system. In 1822 Mr. Gideon Algernon Mantell (afterwards Dr. Mantell, F.R.S.) correctly showed that it was of fluviatile origin, though intercalated between marine Oolite below, and Greensand, also marine, above. The name, Wealden Formation, was first introduced by Mantell, to whom it had been suggested by his friend J. P. Martin, Esq., of Pulborough. The Wealden has been generally divided into the Weald Clay, constituting the upper beds, the Hastings Sand in the middle, and Purbeck beds below; but the Purbeck beds are now considered to be Oolite, or to be intermediate between the Oolite and the Wealden. The thickness of the true Wealden formation in Swanage Bay, where it is most highly developed, may be 2,000 feet. Its fauna consists of great reptiles, fishes of the genus Lepidotus, and freshwater mollusces, Physa, Limnæa, &c.; its flora of Conifers, Cycads, and Ferns, but no Dicotyledonous Angiosperms. The delta of the old Wealden river has been traced about two hundred miles from east to west, and a hundred miles from north to south. Much has been swept away by denudation. The Quorra or Niger in Africa covers 25,000 square miles; the Wealden river therefore probably approached, and may possibly have exceeded it in magnitude. It drained a large part of a continent, the area and exact situation of which are unknown. The Wealden of Hanover and Westphalia constitutes the delta of a second river distinct from the first. [WEALD-CLAY, HASTINGS-SAND, PURBECK-BEDS.]

I. *Literally:*

1. *Zool.:* The genus Putorius; specif., *Putorius vulgaris,* the Common Weasel. Length about twelve inches, of which the tail occupies nearly a quarter. Body extremely slender and arched, head small and flattened, eyes black and remarkably quick and lively, ears short and rounded; the neck is long, being but little shorter than the trunk and very flexible; tail short, and without a terminal tuft of hair; legs short and furred to end of toes. Upper part light reddish-brown, under surface quite white. It feeds on mice and rats, moles and small birds, and, according to Bell (*Brit. Quadrupeds,* p. 183), it would appear that this animal ought rather to be fostered as a destroyer of vermin than extirpated as a noxious depredator. Occasionally the weasel becomes white in winter, though the tail always

retains its reddish tinge, as that of the Ermine does its black tip. In this white stage the Weasel is the *Mustela nivalis* of Linnæus.

* 2. *Ornith.:* A bird which Browne calls *Mustela variegata*. Probably the Smew (q.v.); *Mergus albellus*, the *M. mustelaris* of Gesner.

A. *As substantive:*

I. *Ordinary Language:*

1. A general term for the atmospheric conditions, or the state of the air, with special reference to the questions of cold or heat, pressure, dryness, humidity, presence or absence of rain, occurrence of sunshine, or any other meteorological phenomena: as warm *weather*, dry *weather*, wet *weather*, stormy *weather*, hazy *weather*, &c. The science which investigates the causes of these changes of the atmosphere, and attempts to trace them to their origin is called Meteorology (q.v.).

"When the wind is thus settled, we have commonly fair *weather*."—*Dampier: Discourse of Winds*, ch. i.

¶ In some tropical countries the seasons are so regular that the weather for any particular month may be predicted long beforehand without any considerable liability to error. For instance, it may safely be said that from November 1 to June 1 in Central India there will be only two or three rainy days, while between June 15 and September 15 there will be few days that are not rainy. [MONSOON, SEASON.] Prediction in any particular year in temperate climates, especially in Western Europe, is much more liable to error, though on a series of years there is tolerable uniformity, so that such expressions have arisen as March winds, April showers, and November fogs. The popular belief that the weather can be predicted by noting the changes of the moon is erroneous. Most other popular notions regarding weather signs are more or less accurate. In predicting the weather in Great Britain the meteorologists labor under this great disadvantage, that the approach, say, of a depression from the Atlantic, the ordinary precursor of a storm, cannot be telegraphed till it has reached the west coast of Ireland. If, on the contrary, a storm crossing the United States from the far west be moving towards New York, its progress can be telegraphed to that city whenever it reaches the states adjoining the Rocky Mountains.

¶ It is probable that weather-beaten should really be weather-bitten (q.v.). In some cases it is undoubtedly a corruption of the latter word: as in *Shakesp.: Winter's Tale*, v. 2:—

Ichthy.: Misgurnus fossilis, called also the Mud-fish and Thunder-fish. It is about a foot in length, dark-brown above, flecked with black; abdomen orange, with black spots. In Germany and Austria it is regarded as a weather-prophet, because it usually comes to the surface about twenty-four hours before bad weather, and moves about with unusual energy. This habit has sometimes led to its being confined in a glass globe as an animated barometer. (*Seeley: Freshwater Fishes of Europe.*)

The freezing of water within their interstices also has a destructive effect. When rocks are composed of two or more minerals, which expand differently when heated, and contract differently when they become cold, a powerful destructive agency is established. The carbon dioxide of the air acts on rocks containing lime, and rain and wind remove the bicarbonate. Wind also at times raises sand, which scours the rocks and somewhat wastes them away. 2. *Zool.* (*Pl.*): The Tubitelæ (q.v.). (*Griffiths: Cuvier*, xiii. 404.)

weaver-bird, *s.*

Ornith.: A popular name for any species of the family Ploceidæ (q.v.). Both the scientific and trivial names of these birds have reference to the remarkable structure of their nests. The Weaver-birds are large finches, with somewhat elongated bodies, moderate wings, long tails, and very bright coats, the latter often varied in the breeding season. Yellow and yellowish-red are the prevailing tints, but species occur in which black, red, white, or gray predominates. The Weaver-birds are extremely social, and many of the species live in large colonies during the period of incubation. The nests of the various species differ considerably in shape and general structure, some (as the genus Oriolinus), building a separate nest for the male, while the female sits in another on her eggs, till relieved by her mate; others again contain more than one chamber, as that of the Golden Weaver-bird, *Ploceus galbula*; while the Social Weaver-

MAHALI WEAVER-BIRD (*Ploceus taha*) AND NEST.

birds, *Ploceus* or *Philetærus socius*, construct an umbrella-like roof, under which from 800 to 1,000 separate nests have been found. But in all cases fibres, slender twigs, or blades of grass are the materials employed, the whole being tightly woven, after having been rendered more flexible and adhesive by the application of saliva. The nests themselves consist of a more or less globular portion, elongated into a tube below, with the entrance at the bottom or at the side. They are very generally suspended at the extremities of branches, and often over water, probably as affording security against monkeys, snakes, and other enemies. The Mahali Weaver-bird (*Ploceus taha*) is said to insert thorns into its nest, as a further protection against marauders. It is a noteworthy fact that the Golden Weaver-bird has begun to build on the telegraph-wires by the side of the railway in Natal, owing to the rapid destruction of the willows before advancing civilization (*Nature*, May 31, 1888).

wēav'-ĭng, ***wev-yng,** *pr. par., a., & s.* [WEAVE (1), *v.*]

A. & **B.** *As pr. par. & particip. adj.:* (See the verb).

C. *As subst.:* The act of one who weaves; the act or process of producing cloth, &c., by the combination of flexible fibres. It is an art of very remote antiquity. The frame or apparatus on which cloth is woven is termed a loom (q.v.). In all kinds of weaving, whether plain or figured, one system of threads, called the woof or weft, is made to pass alternately under and over another system of threads called the warp, web, or chain. The essential operation of weaving is the successive raising of certain threads of the warp, and the depression of others for the reception of the weft shot. This operation is called shedding. The web, which is of any convenient length, is kept stretched between two parallel beams, fixed horizontally between upright standards. The one beam, on which the warp is wound, is called the yarn-roll, and the other on which the cloth is wound, the cloth-beam or roll. The weft-shot is introduced or carried through the shed by the shuttle. Weaving is performed by hand on hand-looms, and by steam or other motive power on power-looms. In its most general sense, the term comprehends not only the making of those textile fabrics prepared in the loom, but also net-work, lace-work, &c. Where the colour of the yarn in warp and weft is the same, the process is called plain weaving, and the result is a fabric of uniform colour, in which the warp and weft threads regularly interlace. Pattern weaving consists either in using different colours in warp or weft or in both, or in weaving with more complicated machines, or in combining both variations. Double weaving consists in weaving two webs simultaneously one above the other, and interweaving the two at intervals so as to form a double cloth. Kidderminster or Scotch carpeting is the chief example of this process. Pile weaving is the process by which fabrics like velvet, velveteen, corduroy, and Turkish carpets are produced. [LOOM (1), JACQUARD.]

¶ Though skins of animals formed the chief clothing material in the Stone Age, yet the arts of spinning and weaving were practised, spindle-whorls and fabrics (the material is flax, hemp being unknown) having been found in the Swiss lake-dwellings of that period. The art of weaving seems to have existed in China and in India from a remote period of antiquity. It is also represented in sculpture on the Egyptian monuments at Thebes. Women, many of them slaves or devotees attached to temples, wove fabrics in Greece and Rome, while in Egypt the work was performed by men. The primeval looms were everywhere rude, but the Hindoos, with humble machines, turn out excellent fabrics. In 1132 and 1331 continental weavers settled in England. Several inventions in the art of machine weaving were made in the eighteenth century, and in 1801 Jacquard exhibited in Paris the loom which bears his name, and which has been of inestimable service in the weaving of patterns in cloth. In 1809 Heathcoat invented the bobbin-net machine. Within the present century the art of weaving has made great progress, numerous inventions having been made in the United States and elsewhere.

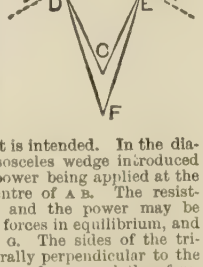
wĕdge (1), ***wegge,** *s.* [A.S. *wecg* = a mass of metal, a wedge; cogn. with Dut. *wig, wigge* = a wedge; Icel. *veggr;* Dan. *vægge;* Sw. *vigg;* O. H. Ger. *wekki, weggi;* M. H. Ger. *weche* = a wedge. From the same root as *wag.*]

1. A piece of wood or metal, thick at one end and tapering to a thin edge at the other. It is a body contained under two triangular and three rectangular surfaces. The wedge is one of the mechanical powers, and is used for splitting wood, rocks, &c., for exerting great pressure, as in the oil-press [WEDGE-PRESS], and for raising immense weights, as when a ship is raised by wedges driven under the keel. All cutting and penetrating instruments, as knives, swords, chisels, razors, axes, nails, pins, needles, &c., may be considered as wedges, the angle of the wedge being in such cases more or less acute, according to the purpose for which it is intended. In the diagram, A B C is an isosceles wedge introduced into a cleft D F E, power being applied at the point H, in the centre of A B. The resistance on each side and the power may be considered as three forces in equilibrium, and meeting in a point G. The sides of the triangle A B C are severally perpendicular to the directions of the three forces, and therefore, P : ½R : : AB : AC, or the power is to the total resistance as half the back of the wedge is to the side of the wedge. The mechanical power of the wedge is increased by making the angle of penetration more acute. But no certain theory can be laid down concerning the power of the wedge, since being usually produced by the percussion of a hammer, mallet, &c., every stroke of which causes a tremor in the wedge, the resistance at the sides is for the instant thrown off.



"Forth goes the woodman . . . to wield the axe
And drive the *wedge*, in yonder forest drear."
Cowper: Task, v. 43.

Wedgwood-ware, *s.*

Pottery: A peculiar kind of ware made by Josiah Wedgwood (1730–95), in which artistic designs and treatment were joined to mechanical and technical excellence. Professor Church thus enumerates the several varieties or "bodies" of the ware in the order of invention or improvement: 1. Cream-coloured ware, called Queen's ware, in various hues of cream-colour, saffron, and straw. 2. Egyptian black, or basaltes ware, used for seals, plaques, life-size busts, medallion portraits, &c. 3. Red ware, or Rosso antico, not equal in quality of colour or fineness of grain to the earlier work of John Philip Elers, of Bradwell Wood. 4. White semi-porcelain, or fine stoneware, differing from the white jasper in its pale straw-coloured or grayish hue, and in its waxlike smooth surface and subtranslucency. 5. Variegated ware, of two kinds, one a cream-coloured body, marbled, mottled, or spangled with divers colours upon the surface and under the glaze; the other an

improved kind of agate ware, in which the coloured clays in bands, twists, stripes, and waves constituted the entire substance. 6. Jasper ware, in which the chief triumphs of Wedgwood were wrought, resembling outwardly the finest of his white terra-cotta and semi-porcelain bodies. One of his earliest recipes for this last-named ware was, in percentage, barytes, 57·1; clay, 28·6; flint, 9·5; barium carbonate, 4·8; the novelty of these components being the use of the barytes and barium carbonate. A very little cobalt was occasionally added, even to the white jasper ware, to neutralize the yellowish hue, and by introducing a little Cornish stone or other felspathic material it became less opaque and more wax-like. There are seven colours in this ware besides the white—blue of various shades, lilac, pink, sage-green, olive-green, yellow, and black—and it is remarkable for the absence of bubbles and holes, the flatness of the field, and the uniformity of grain. It was produced in numberless forms—cameos, intaglios, portrait medallions, statuettes, vases, &c., and the yellow variety is rare. Wedgwood's artistic work consists not only in copies of antique gems and in the adaptation of antique designs, but in the original productions of many English and foreign draughtsmen and modellers: foremost among the former must be placed the great artist Flaxman. His chief mark is the name "Wedgwood," impressed in Roman characters in the paste before firing, the size of the letters ranging from $\frac{1}{4}$ to $\frac{1}{32}$ of an inch in height. During his partnership with Bentley the name of the latter was conjoined to his own. In some cases the word "Etruria" is added. The name "Josiah Wedgwood," with a date beneath, belongs to a time when the works at Etruria—now a town of about 5,000 inhabitants—were carried on by the son of the founder; in more recent times the simple name "Wedgwood" has been reverted to. Small marks, chiefly those of workmen, are found on pieces of old Wedgwood ware; Miss Meteyard gives no fewer than one hundred of these, but Wedgwood—like too many other manufacturers, both past and present—suppressed as far as possible such indications of the individuality of his designers.

The reference is to the practice of giving a present to the bride on the morning after marriage; cf. Ger. *morgengabe* = a nuptial (lit. = morning) gift.]

weēk, *weeke, *weke, *wike, *woke, *wouke, *wycke, *wyke, *s.* [A.S. *wice, wicu, wuce, wucu;* cogn. with Dut. *week;* Icel. *vika;* Sw. *vecka;* O. H. Ger. *wecha, wehha;* M. H. Ger. *woche;* Dan. *uge.*]

I. *Ordinary Language:*

1. The space of seven days; the space from one Sunday, Monday, &c., to another; the most obvious and convenient division of the natural or lunar month. The division of time into weeks was not found among the aborigines of America when the New World was discovered, nor did it exist among the Polynesians, the Japanese, or, it is now believed, the Chinese. It is nearly universal in India, and was found thoroughly rooted when the first Christians went to that country. So has it been from a period of high antiquity in Scandinavia, the names of the several days being connected with identically the same planets in the two regions; so that, if at noon on Sunday in Sweden one could be transported in a moment to India, he would find it Aditwar (= Sunday) there, and so of any other day in the week. The Hebrews, and it is thought the other Semites, had the institution of weeks [II.], the days apparently being simply numbered first, second, third, &c. During the early centuries of their history the Greeks and the Romans had not the institution of weeks, there having been ancient forgery in connection with Homer's oft-quoted passages on the subject. Dion Cassius, in the second century after Christ (*Hist.*, xxxvii. 18), considered that the week with the planetary names of the days had been introduced into Rome only recently, and from Egypt. The establishment of Christianity under Constantine confirmed the change, and thence the septenary division of time spread to the whole Christian, and subsequently to the Muhammadan, world. One school of theologians attributes the wide prevalence of septenary institutions to the Sabbath having been divinely instituted at the Creation; another regards the week as a fourth part of a lunar month.

* 2. Applied to the week-days, or working-days, as opposed to Sundays.

"Divide the Sunday from the *week*."
Shakesp.: Hamlet, i. 1.

II. *Script.:* In Genesis ii. 2, 3, the reason why the division of time into weeks began is stated to be that God occupied six days in the work of creation, and rested upon the seventh day, which he consequently hallowed. Seven from this time forth constantly occurs, and obviously becomes a sacred number. (Cf. Gen. iv. 15, vii. 2, xxi. 28, xxix. 18, 20, xxxiii. 3, &c.) Traces of division of time into weeks appear in Gen. vii. 4, viii. 10, 12, &c., till the Sabbath (q.v.) is mentioned by name (Exod. xvi. 23, 26). A week of weeks (= 49 days) was also recognized. [¶ (1).] The first day of the seventh month was a Sabbath (Lev. xxiii. 24), and the whole month was somewhat sacred, being little more than a succession of feasts and Sabbaths (verses 27, 28, 34, 39, &c.). The seventh year was sacred, the very land obtaining Sabbatic rest (Exod. xxiii. 11, Lev. xxv. 1–7, Deut. xv. 9, 12); and after seven times seven years came the Jubilee (q.v.) (Lev. xxv. 8–55). Seventy, as having seven for one of its factors, was sacred (Exod. xxiv. 1), and seventy weeks constituted a prophetic period. (Dan. ix. 24–27).

I. *Ordinary Language:*

1. That property of bodies through which they tend towards the centre of the earth; gravity.

2. The measure of the force of gravity, as determined for any particular body; in a popular sense, the amount which any body weighs; the quantity of matter as estimated by the balance, or expressed numerically with reference to some standard unit.

"The *weight* of an hair will turn the scales between their avoirdupois."—*Shakesp.: 2 Henry IV.*, ii. 4.

3. A piece (usually) of metal of known gravity, and used with scales to determine the gravity of other bodies.

4. A particular scale, system, or mode of ascertaining the relative heaviness of bodies: as, troy *weight*, avoirdupois *weight*, &c. Weights vary according to the commodity they are intended to weigh. Thus the following are all in use: (1) The grain, computed decimally, for scientific purposes; (2) troy weight; (3) troy ounce, with decimal multiples and divisions, called bullion weight; (4) bankers' weights for sovereigns; (5) apothecaries' weight; (6) Diamond weight and pearl weight, including the carat; (7) Avoirdupois weight; (8) weights for hay and straw; (9) wool-weights, using as factors 2, 3, 7, 13, and their multiples; (10) coal-weights, decimal numbers 1, ·5, ·2, ·1, ·05, ·025. Besides these the gramme, &c., of French metric system, are used by many scientists. There are also ten different stones. A stone of wool at Darlington is 18 lbs.; a stone of flax at Downpatrick is 24 lbs.; a stone of flax at Belfast is 16½ lbs, and also 24½ lbs. The hundred weight may mean 100 lbs., 112 lbs., or 120 lbs. A pound weight varies in the avoirdupois and the troy.

9. Power, influence, importance, consideration.

II. *Technically:*

1. *Physics:* The measure of the force of a body acted on by gravitation; the downward pressure of a body thus acted upon. As it is produced by the influence of gravity on all the particles of the body, it is proportioned to the quantity of matter in the body. Weight obviously exists in solids and liquids; it does so also in gases, though their extreme fluidity and expansibility may seem to suggest the contrary. Weight being produced by the action of gravity, it slightly increases as the body is removed from the equator towards the poles, owing to the flattening of the earth in the latter region; the diminished speed at which the earth rotates in high latitudes has a similar influence; a body also weighs less on a mountain top than on a plain, being at a greater distance from the earth's mass. It is also slightly affected by the temperature of the air and its barometric pressure. [DENSITY, GRAVITY.]

2. *Mech.:* The resistance which in a machine has to be overcome by the power; in the simpler mechanical powers, as the lever, wheel and axle, pulley, and the like, usually the heavy body that is set in motion or held in equilibrium by the power.

3. *Pathol.:* A sensation of heaviness or pressure over the whole body, or any portion of it: as, a *weight* on the stomach. In the case of the organ just mentioned, this generally arises from undigested food.

¶ *Dead weight:* A heavy, oppressive, or greatly impending burden.

weight-nail, *s.*

Naut.: A nail heavier than a deck-nail, and used for fastening buttons, cleats, &c.

weight-rest, *s.*

weight-thermometer, *s.*

Instruments: A glass cylinder to which is joined a bent capillary glass tube, open at the end. It is weighed first empty, and then when filled with mercury, the subtraction of the smaller from the larger number gives the weight of the mercury. It is then raised to a known temperature, when a certain quantity of the expanding mercury passes out. From this the temperature can be deduced.

It is well developed in the vicinity of Wenlock, and is considered to be above four thousand feet in thickness. There are two divisions: (1) the more ancient, the Woolhope-limestone and Shale, the Tarannon-shale, and the Denbighshire Grits; (2) the Wenlock-limestone and Shale. The Woolhope Limestone and Shale occur at Woolhope, Malvern, &c. [Woolhope.] Their thickness is 150 feet. [For Tarannon Shales, see Tarannon.] The Denbighshire Grits constitute mountain ranges there and in South Wales, and on decomposing form a sterile soil. The Wenlock-shale is often soft, so as to constitute a kind of mudstone rich in crinoidea, corals, brachiopods, &c. It is about 1,400 feet thick. The Wenlock, or Dudley, Limestone is about 150 feet thick. It forms a continuous ridge in Shropshire for about twenty miles from south-west to north-east, with corals, encrinites, and trilobites. [Dudley.] It is of a concretionary nature, some of the concretions, locally termed ballstones, being eighty feet in diameter. The whole Wenlock fauna consists of 171 genera and 530 species. Of these there are 76 species of Actinozoa, 68 of Echinodermata, 78 of Crustacea, 101 of Brachiopoda, 44 of Lamellibranchiata, and 169 of other classes. The fine or compensation due from the offender varied in amount according to his rank and station and that of the person killed or injured, and also according to the nature of the injury. It was in general paid to the relatives of the person killed, or, in the case of a wound or other bodily harm, to the person injured; but, if the cause was brought before the community, the plaintiff only received part of the fine, the community, or the king, when there was one, receiving the other half.

[Lycanthropia, Lycanthropy.] In Bulgaria the legends of werewolves are inextricably mixed up with those of the vampires [Vampire, A. I. 1.], and the same sign—the meeting of the eyebrows, as if the soul were about to take flight to enter some other body—is held to be conclusive evidence that a person belongs to one of these classes.

Hist.: An assembly of divines, lay assessors, &c., which met in obedience to an ordinance of the Lords and Commons, issued June 12, 1643—

"For the calling of an assembly of learned and godly divines to be consulted with by the Parliament for the settling of the government and liturgy of the Church of England, and for vindicating and clearing of the doctrine of the said Church from false aspersions and interpretations."

A hundred and twenty clergymen, with ten lords and twenty commoners, or lay assessors, were nominated to carry out the ordinance. The meeting was forbidden by the king on June 22, but no notice was taken of the prohibition. On July 1 sixty-nine of the nominated members attended in Henry VII.'s Chapel in Westminster Abbey, and the assembly began. They sat 1,163 times, their last meeting being on Feb. 22, 1649. On Sept. 15, 1643, commissioners arrived from the Church of Scotland to aid in the deliberations. whāle, ***whal,** ***qual,** *s.* [A.S. *hwæl*; cogn. with Dut. *walvisch* = whale-fish; Icel. *hvalr*; Dan. & Sw. *hval*; Ger. *wal*, *wallfisch.*]

1. *Zool.:* The popular name of any species or individual of the modern order Cetacea (the Cetacea Ordinaria of older writers). [Cetacea.] The head is generally large, and in some species constitutes more than one-third of the entire length; mouth always wide, with stiff, immobile lips; fore limbs reduced to flattened fin-like paddles, no external traces of hind limbs, though sometimes the vestige of a femur is present in the shape of a nodule of bone about the size of a walnut. Immediately below the skin is a thick layer of fat, held together by fibrous tissue, constituting the blubber [Blubber, *s.*, 2.]; and in nearly all there is a dorsal fin. The eye is small; there is no external ear, but a minute auditory aperture, and the nostrils, which are usually called "blowholes," are situated on the top of the head, except in the Sperm Whale, which has them at the extremity of the snout. Whales are found in all seas, and some, like the Beluga (q.v.), ascend large rivers. All pass their lives in water, and are absolutely helpless on land. They rise frequently to the surface to breathe, and usually expose the highest part of the head where the nostrils are situated. The so-called "spouting" of the whale is only the ordinary act of breathing. When the animal rises to the surface it forcibly expels from the lungs the air taken in at the last previous inspiration, which is of course heated and loaded with watery vapour. As this rapidly condenses when expelled, it forms a column of spray, which has been erroneously assumed to be water taken in by the mouth and ejected by the nostrils. In hunting the whale the harpoon may pierce the lungs or air-passages, and then a column of blood may be forced high in the air through the nostrils, but—making due allowance for the different methods of breathing—similar result follows wounds in the respiratory organs of other mammals. All the Cetacea prey on living food of some kind—chiefly fish, small floating crustacea, pteropods, and squids. The genus Orca alone attacks and devours other warm-blooded animals, such as seals and individuals of its own order. Whales are for the most part timid, inoffensive animals, active and affectionate, especially the cows towards their calves, of which they produce but one, or rarely two, at a time. They generally swim in herds, or "schools," though some species have been met with singly or in pairs. In size they differ greatly: some of the Delphinidæ are only about four feet in length, while the gigantic Sperm-whale, or Cachalot (q.v.), reaches some fifty feet, which appears to be never greatly exceeded in this species, though stories are told of animals nearly double as long, and *Balænoptera sibbaldii*, probably the largest living whale, attains the length of eighty feet. Popularly the name is used in a more restricted sense than that in which it is employed scientifically. The members of the Platanistidæ and Delphinidæ are called Freshwater Dolphins and True Dolphins respectively, though the Pilot-whale, the Beluga, or White Whale, and the Narwhal belong to the latter family. The great commercial value of the oil which all the Cetacea yield, and the special products of some—whalebone, spermaceti, ivory—subject them to relentless persecution, which has vastly diminished their numbers. In fact, the whale-fisheries of this as well as other countries have now dwindled into insignificance, partly on account of the extensive substitution of petroleum and certain vegetable oils, but chiefly because of the great diminution in the number of whales; which conditions have tended to make this industry comparatively unprofitable

of recent years. The Right (or Greenland) Whale (*Balæna mysticetus*), the chief object of pursuit of the whalers, is confined to the Arctic regions. It was formerly thought to extend to the Antarctic circle, but the Cape or Southern Whale (*B. australis*) is now generally admitted to specific distinction. The former is from sixty to seventy feet long, velvety black above, with the lower parts white; the latter somewhat smaller and of a uniform black. Other species are the Biscay Whale (*B. biscayensis*), the object of a fishery by the Basques down to the end of the eighteenth century; the Japan whale (*B. japonica*), and the South Pacific whale (*B. antipodarum*). They are exceedingly alike in habit, and they do not differ greatly in appearance. [HUMPBACKED-WHALES, PHYSETER, II., RORQUAL, ZEUGLODON.]

Bot.: Triticum vulgare, an annual cereal grass, possessing a four-cornered imbricated spike, with four-flowered spikelets, having their valves ventricose, ovate, truncate, mucronate, compressed under the apex, the nerve somewhat prominent. Its native country is not known, but has been supposed to be Persia or Siberia. The plant may have been so altered by cultivation as now to be very different from the parent. Fabre and Prof. Buckman think that it may have been developed from Ægilops (q.v.), a genus allied to Triticum, though Henfrey objects to this identification. Wheat was cultivated from an early period in Egypt and the neighbouring countries [2.], as also by the Greeks, the Romans, &c. Now it has spread over a great part of the world, flourishing in climates considerably differing from each other. In the European and Asiatic zone, which includes France, England and part of Scotland, part of Germany, Hungary, the Crimea, Mount Caucasus, and part of Central Asia, wheat is almost the only cereal cultivated; in a zone a little further north it is associated with rye. The great wheat-producing country of the present day, however, is the United States, and particularly the states of the northern Mississippi basin, the wheat production of this region sufficing not only for this country, but to supply the surplus demands of the countries of Europe. This great wheat-producing region, in fact, has been looked upon as the wheat granary of the world, but other countries are now coming into competition with it, particularly the Canadian provinces lying north of it. At present there are more than 38,000,000 acres in the United States devoted to wheat production, the total crop being, in 1890, nearly 400,000,000 bushels, in 1891, 545,000,000 bushels. Russia comes second in acreage, and France third, while India has also a large acreage in wheat.

wheat-fly, *s.*
Entom.: Cecidomyia tritici; a yellow and orange coloured two-winged fly, about a tenth of an inch long, with black eyes, the female of which deposits her eggs in the heart of the wheat blossom. Each granule has a hilum, or central spot, and many of the larger ones exhibit faintly marked concentric rings.

WHEAT-STARCH.
(Magnified 100 diameters.)

whēat'-ēar, *s.* [Etym. doubtful. The name has been explained from the arrival of the bird "when the wheat is in the ear; but the reason is fallacious; for the wheatear arrives in Britain before that period, or, according to Fuller (*Worthies: Sussex*), "because fattest when wheat is ripe, whereon it feeds." Some connect the name with A.S. *hwæt* = keen, a supposed keenness of hearing being suggested by the decided marking of the feathers near the auditory apertures. Halliwell gives Linc. *whitter* = to complain. Smollett (*Travels*, lett. iii.) says the name is corrupted from *white-arse*, which is supported by the French name *cul blanc*, and the English names *White-tail, White-rump.*]

Ornith.: Saxicola œnanthe; called also the Fallow-chat and Fallow-finch. A well-known British visitant, arriving about the early part of March and remaining till the end of autumn. These birds are in excellent condition in August and September, and many thousands are taken in traps every year for the table, under the name of British Ortolans.

wheel, ***weol, *wheele,** *s.* [A.S. *hweól, hweohl, hweowol;* cogn. with Dut. *wiel;* Icel. *hjól;* Dan. *hiul:* Sw. *hjul.*]

I. *Ordinary Language:*

1. A circular frame or solid disc turning on an axis. The essential feature of a wheel is rotation, partial or entire. Its motion may be intermittent, oscillatory, or continuous. Its form may be circular or otherwise; its contour regular or irregular. Its function may be to transmit motion or to modify it. Its application may necessitate cogs of a given form, or it may be smooth, its surface being free from contact with other portions of the machine. It may be hollow, for the conveyance or measurement of fluids; or it may be the means of propulsion of fluids; or conversely it may be propelled by them. It may form a support, and, by rotation, be made effective in assisting transportation. As used for vehicles, the wheel has cast-iron hub (nave) and tire, and wrought-iron or wooden spokes. The felly has holes flaring to the outside, so as to hold the ends of the spokes, which have conical heads to fit the openings. The inner ends of the spokes pass through the outer rim of the hub, and are secured by nuts. The insertion of the spokes in circles near the ends of the hubs gives them an extended base or bearing, and strengthens the wheel against lateral strain. Wheels receive different names according to the purpose for which they are used: as, *balance-wheel, cog-wheel, crown-wheel, fly-wheel, paddle-wheel, pinion-wheel, scape-wheel, tread-wheel, turbine,* &c., which will be found described under their respective heads.

2. A machine for spinning yarn or thread; a spinning-wheel (q.v.).

"I see the eldest daughter at her *wheel*,
Spinning amain." *Wordsworth: Excursion*, vi.

3. In the same sense as II. 1.

4. An apparatus, machine, instrument, or other object having a wheel-like shape, or the essential feature of which is a wheel: as—

(1) The revolving disc used by potters in modelling; a potter's wheel.

"Then I went down to the potter's house, and, behold, he wrought a work on the *wheels*."—*Jeremiah* xviii. 3.

(2) An instrument of torture formerly used for criminals of the most atrocious class. In some places it consisted of a carriage-wheel, on which the criminal was placed with his face upwards, and his legs and arms extended along the spokes. On the wheel being moved round, the executioner broke the victim's limbs by successive blows with a hammer or iron bar, and after a more or less protracted interval put an end to his sufferings by two or three severe blows, called *coups de grâce* (mercy-strokes) on the chest or stomach, or by strangling him. In Germany its use lingered down to the commencement of the nineteenth century.

"Let them pull all about mine ears, present me
Death on the *wheel*, or at wild horses' heels."
Shakesp.: Coriolanus, iii. 2.

*(3) A circular body, a disc, an orb.

*(4) A carriage, a chariot.

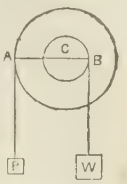
(2) To employ great means or exertions for trifling ends.

3. *To put one's shoulder to the wheel:* [Shoulder, *s.*].

4. *Wheel and axle:* A modification of the lever (q.v.), and one of the mechanical powers. Its most simple form is a cylindrical axle, on which a concentric wheel is firmly fastened, the whole being suspended horizontally. When this power is employed to raise heavy weights, the weight is attached to a rope wound round the axle, and the power applied to a rope placed in the grooved rim of the wheel, or to a handle fixed at right angles to the rim of the wheel, for which an ordinary winch may be substituted. From the diagram it will be seen that this machine is a lever, the extremities of which are not points as in the normal form [Lever, *s.*], but the circumference of the circles (the wheel and the axle), whose radii are C A, C B respectively. Hence the power and the weight are not attached to particular points in these circumferences, but to cords wound round them; and the imaginary simple lever A B (formed by joining the points A, B, where the cords become tangents to the circles) remains unaltered in position and magnitude. The conditions of equilibrium are that P × C A = W × C B; or, since the circumferences of circles are proportional to their radii, that P : W : : circumference of the axle : the circumference of the wheel (or, if a winch is employed, the circumference of the revolution described by the power).



TRANSVERSE SECTION OF WHEEL AND AXLE.

A. *As substantive:*

Eng. Hist.: A term applied to the members of one of the great political parties in Great Britain. Originally it was a Scottish term, and appears to have been first used in Scotland in the reign of Charles I., and in England in that of Charles II. According to Bishop Burnet's account (*Own Times,* bk. i.) of the origin of the word:

"The south-west counties of Scotland have seldom corn enough to serve them all the year round, and the northern parts producing more than they used, those in the west went in summer to buy at Leith the stores that came from the north. From the word *whiggam,* used in driving their horses, all that drove were called the *whiggamors,* contracted into *whigs.* Now in the year before the news came down of duke Hamilton's defeat, the ministers animated their people to rise and march to Edinburgh; and they came up, marching on the head of their parishes, with an unheard-of fury, praying and preaching all the way as they came. The marquis of Argyle and his party came and headed them, they being about 6,000. This was called the 'Whiggamors' Inroad'; and ever after that all who opposed the court came in contempt to be called *whigs.*

From Scotland the term was transferred to England, and was applied to the political party opposed to the Tories. It was first assumed as a party name by those who were chiefly instrumental in placing William III. on the throne. As a political term it has now almost fallen out of use, being superseded by the term Liberal, the more extreme members of which party have assumed the name of Radicals. [Liberal, Radical, Tory, Whigamore.] During the colonial and revolutionary period of the United States the term Whig was applied to those who opposed the British rule, those who favored it being styled Tories. In 1834 it was adopted as the name of the successors of the old National Republican party. The Whig party died out after 1852, and was succeeded by the present Republican party.

Creech: Horace; Sat., iii. 1.

¶ In mediæval times in England the punishment of whipping was inflicted on persons of low rank convicted of petty larceny and other small offences. By Act 1 George IV., c. 57, this punishment was abolished in the case of women. The Act 26 & 27 Vict., c. 44, extends whipping to males of any age convicted of robbery with violence, such as garroting. In the United States whipping does not exist as a punishment except in the State of Delaware, in which it is retained in the case of minor offences, such as larceny. In Europe the most frightful example of it was that formerly practiced in Russia, the whipping with the knout, in which the victim often died under the lash. It is now abolished. Whipping was formerly common in the army and navy, but has been replaced by milder punishments.

whĭrl'-pôôl, * **whirl-pole**, * **whirle-poole**, *s.* [Eng. *whirl*, and *pool*.]

1. *Ord. Lang. & Hydrology:* A spot in a river or in the sea in which, through obstructions to flowing water, produced by banks, islands, rocks, or by winds or currents, a rotatory motion is imparted to the moving fluid. Revolutions of such a nature, on a minute scale, may be seen on nearly every streamlet; but the term whirlpool is used almost exclusively of the same phenomenon on a large scale. There is a tendency to vortical motion below most waterfalls. The Maelström, which obtained such celebrity, is in large measure mythic. A strong tidal current runs between the islands of Moskoë and Warae, where it exists, at one time from north to south, at another in the reverse direction. When the wind acts obliquely on the tidal current, a certain approach to vortical motion may be discerned, but there is no genuine whirl. It is the same with the classic whirlpool alleged to exist between Scylla and Charybdis. There is a tumult of waters in stormy weather, but nothing more. The whirlpool of Coryvrechan, or Corrievreken, alluded to by Scott (*Lord of the Isles*, iv. 11) is situated between the north of Jura and the little island of Scarba in the Hebrides. The strong current which runs through the channel between the two islands encounters a pyramidal rock rising to within fifteen fathoms of the surface, and, becoming deflected from the straight course, takes a circular form.

whĭrl'-wind, * **whyrle-wynde**, *s.* [Icel. *hvirfilvindr*; Dan. *hvirvelvind*; Sw. *hvirfvelvind*.]

1. *Lit. & Meteor.:* A violent wind moving spirally, as if revolving round an axis, which has at the same time progressive motion. Whirlwinds are produced by two currents of air proceeding in different directions, and the course of the whirlwind is determined by the stronger of the two currents. Thus, supposing a whirlwind to arise from a north wind blowing somewhat to the west of a south wind, when the outer currents come in contact if the north wind is the stronger, the direction of the whirl would be north, west, south, east; but the whirl-current will move in a contrary direction if the south wind be the stronger. Whirlwinds often originate in the tropics, especially in flat, sandy districts, during the hot season. The ground becoming unequally heated by the sun, gives rise to ascending columns of heated air, which result in whirl-currents drawing up large clouds of dust. [SIMOOM.] The whirlwind seems to be a less violent form of the rotating storm known as the tornado (q.v.), the most destructive for its extent of all storms. Its principal seat is the central United States. [WATERSPOUT.]

Sweeps up the burden of whole wintry plains
At one wide waft." *Thomson: Winter*, 269.

There is a Whispering Gallery at St. Paul's Cathedral, London, and another at Gloucester Cathedral.

"*Whispering galleries* are formed of smooth walls having a continuous curved form. The mouth of the speaker is presented at one point, and the ear of the hearer at another and distant point. C. *As subst.*: A game at cards, so called from the silence necessary to play it attentively and correctly. It was formerly also called *whisk*. It is played by four persons, two of whom are partners against the other two. The full pack of fifty-two cards is used, thirteen being dealt out to each player in order, the dealer beginning with himself, and dealing from left to right. The last card dealt is turned face up on the table, and is called the trump card; the suit to which it belongs has for the hand the privilege of taking or being superior to any card of any other suit. The cards rank in value as follows: ace (the highest), king, queen, knave, ten, nine, eight, and so on. The game is commenced by the player on the left hand of the dealer laying one card face upwards on the table, this being called leading off; the player on his left then plays a card of the same suit (if he has one), and is followed similarly by the player on his left. When all have played, the person who has played the highest card takes up the four cards played, these constituting what is termed a trick. If a player has no card of the suit led off, he may play one of any other suit. The winner of the first trick then leads off with any card he pleases for the second trick, the winner of which becomes the leader of the third trick, and so on. The score is taken as follows when the hand is played out: the partners who conjointly have won the majority out of the thirteen tricks, score one point for every trick over six. The ace, king, queen, and knave are called honours, and the partners who hold between them three of these cards score two points, and if they hold all of them they score four points; this is technically known as scoring two (or four) by honours. If each side holds two of these cards, honours are said to be divided. In long whist (now becoming obsolete) ten points make a game; in short whist only five points are required, and in this it is usual to count by tricks alone. A rubber consists of three games, and is won by the partners who score two of them. If one side wins the first two games the third is not played out. There

are several modifications of the game, such as solo whist, three-handed whist, &c. *

white-ants, *s. pl.*

Entom.: A popular name for any of the Termitidæ (q.v.). The resemblance to the ants, Formicidæ, &c., is in the general aspect, their life in social communities, the appearance at certain times of many winged individuals, and the nature of the habitations. But they belong to different orders, the venation of the wings being different. A white ant looks not unlike a soft immature earwig, but without the forceps. White ants constitute the most destructive insect pest to be found in the tropics. They do not attack human beings, their ravages being confined to property. They make their way into houses through some minute aperture which they have found or have themselves formed in the floor or in the wall. Nothing external may reveal the fact that the joists or rafters on which they have been operating are weakened and rendered unsafe by being all pierced internally with their galleries. If they can effect an entrance into a library they bring

up mud and construct tunnels with it so as to glue one book to another, and eat away the leather or cloth by which the boards were affixed to the book itself, besides rounding off the angles of a number of the volumes. Whatever is in danger of them is placed on a table or frame, the legs of which rest on stone stands, surrounded by water. Every historical document in India is in danger from these destructive creatures. Prof. Drummond suggests that white ants probably render the same service in the tropics which earthworms do in temperate lands. The workers and soldiers of the white ants are blind, and rarely appear above ground, making their migrations from place to place under mud tunnels, which they construct as they advance. The workers have large broad heads and strong jaws adapted for gnawing; the soldiers have still larger heads and longer jaws. These wingless forms resemble the true ants in appearance, but the winged male and female forms are much larger and flatter. The latter possess eyes, and leave the nest in great flying swarms in the pairing season, few of them escaping the ravages of their enemies during this period. The "ant hills" erected by them are wonderful in character, those of *Termes bellicosus*, of West Africa, being huge sugar-loaf shaped mounds of earth, from ten to twenty feet high, and so strongly cemented as to bear a man's weight. Internally they present several stories and many chambers, some for the workers and soldiers, one for the king and queen, and others for the eggs and young, and for food supplies. One species is common in the United States, *T. flavipes*; it is fortunately not specially destructive. The female or queen of the termites undergoes remarkable changes, increasing in size till from two to five inches in length, and becoming enormously distended with eggs, which it may lay at the rate of 80,000 a day.

white-light, *s.*

Optics: The apparently simple sensation which is nevertheless really produced on the retina by a certain mixture of colours. Ordinarily white light is composed of the whole of the visible colours of the spectrum, as in sunlight; and the fact of white resulting from this mixture can be demonstrated in many ways, as by re-uniting the spectral colours themselves, or by revolving rapidly a disc [Newton's disc] painted with the colours in separate sectors. A similar mixture of pigments fails, partly because the pigments themselves are never pure colours, and partly and chiefly because pigments act rather as absorbents of the light reflected from the paper or other colours underneath than as additional illuminating colours. White light can, however, be also compounded of three, or of only two colours, which are then called complementary colours. Such white is quite undistinguishable by the eye from white compounded of all the colours; and hence it follows that the eye is not an ultimate appeal in such matters, but is easily deceived by apparently similar total results really compounded of quite different materials. The same applies to colours, which can also be imitated so far as the eye can judge, but analysis by the prism reveals the different composition of the light instantly.

It is abundant throughout the eastern section of the country, extending far into Canada on the north and to the Gulf of Mexico on the south. In aspect it resembles *Q. robur,* the European oak, forming a thick trunk with spreading base, and extending huge spreading boughs when in open spaces. Its name is derived from the whitish color of its bark. In favorable situations it often attains a great size. Trunks of three or four feet diameter are not infrequent, and much larger ones are sometimes found. The wood is strong and hard in texture, but variable in quality, and less durable than that of the best British oaks.

white-pine, *s.*
Botany & Commercial :
1. *Pinus strobus:* Of the lumber yielding trees of the United States the White Pine stands first, being important for its large growth and abundance, and for the soft even grain of its wood, which renders it one of the most easily worked trees for carpentry purposes. No other tree of this country is used so abundantly in the building and other common wood-working arts. This tree abounds from Canada to the Gulf States, but in the Eastern States has been so destroyed by the lumbermen that the former great forests of it have largely disappeared. At one time Maine and Vermont were celebrated for the size of their white pines, but few of these great trees now exist in New England, while the vast forests formerly existing in the mountains of Pennsylvania have been greatly depleted. Within recent years Michigan has been the chief source of white pine lumber, but the immense forests of that state and of Wisconsin are rapidly vanishing before the lumberman's destructive axe. It is estimated that the once seemingly inexhaustible store can last but a few years more at the present rate of indiscriminate destruction. There are large forests still in Canada. The White Pine belongs to the group with five leaves in each tuft. It is often a tree of noble proportions, attaining, in a deep, rich soil, a height of 150 or even 200 feet, the trunks sometimes 80 or 90 feet high without a branch. This renders them valuable for masts. Trunks have been measured from six to nearly eight feet in diameter. The wood of the White Pine is durable for indoor use, particularly when protected by paint, but rapidly decays when exposed to moist air. It is very liable to dry rot. It has been introduced into England, where it is known as Weymouth Pine. It grows well in Germany.

The fishery begins in April and lasts till September, bag-nets sunk four or five feet below the water being employed. The whitebait brought to market are from three to four inches long, pale ashy-green above, silvery-white beneath. They are of exquisite flavor, and favorites among English epicures. They are not known under this name elsewhere. The herring-fry thus caught ranges from two to six or nine months old. "Formerly *who*, *what*, *which* were not relative but interrogative pronouns; *which*, *whose*, *whom* occur as relatives as early as the end of the twelfth century, but *who* not until the fourteenth century, and was not in common use before the sixteenth century." (*Morris: Hist. Outlines of Eng. Accidence*, § 188.) In genuine idiomatic Scotch *who*, or *wha* (including also the possessive and objective), is still only an interrogative, *that*, or *'at*, being the relative.] A relative and interrogative pronoun, always used substantively (that is, not joined to a noun), and referring to one or more persons. ¶ *Who* is used as a relative referring to persons, *which* to things, and *that* to either indifferently. *Who* and *which* are used in two ways: (1) To connect two co-ordinate sentences: as, I met a man *who* told me; I read the book *which* pleased me. Each of these sentences could be turned into two propositions; as, I met a man *and he* told me; I read the book *and it* pleased me. (2) To introduce subordinate or adjectival clauses: as, The book *which* you are reading; the man *who* told me. In these cases *who* and *which* cannot be turned into *and he* or *and it*.

A.S. *hâl* = whole; cogn. with Dut. *heel*; Icel. *heill*; Dan. *heel*; Sw. *hel*; Ger. *heil*; Goth. *hails*; Gr. καλός (*kalos*) = excellent, good, hale; Sansc. *kalza* = healthy, hale. *Whole* and *hale* are doublets, the latter being from the Icel. *heill.*]

¶ (1) *The Wicked :*

Script. : One of the two great classes into which, on moral and scriptural considerations, the Bible divides all mankind, or at least all who have had opportunities of becoming acquainted with revelation. No third or intermediate class is recognised ; nor do the two great classes in any way shade into each other. The primary error of the wicked is that they contemn God (Psalm x. 13) and will not seek him. They plot and carry out evil projects (Psalm ix. 16, xi. 2), and hence the Lord is far from them (Prov. xv. 29), and is angry with them every day (Psalm vii. 11). At last the wicked shall be severed from the just and cast into "a furnace of fire," in other words the place of woe (Matt. xiii. 49, 50).

II. *Technically:*

1. *Law:* The legal declaration of a man's intentions as to the disposal of his property after his death; a testament. In England, no will is valid unless it be in writing and signed at the foot or end by the testator, or by some person in his presence and by his direction. Such signature must further be made or acknowledged by the testator in the presence of two or more persons who in his presence, and in the presence of each other, must sign their names as witnesses. An exception is made in the case of soldiers on active service and mariners, who have power to make nuncupative wills. [Nuncupative.] In Scotland, formerly only personal property could be disposed of by will, real property being conveyed by a disposition or deed in which the testator's life-rent in the subject was reserved; but heritable property can now be so disposed of. The law of the United States agrees substantially with that of England.

"The statute 1 Vict., c. 26, having repealed the act of Geo. II., re-enacts and extends some of its provisions. It avoids bequests, not only to an attesting witness, but to the husband or wife of such witness; and expressly provides that the incompetency of a witness to prove the execution of a *will*, shall not render it invalid. It further enacts that any creditor, or the wife or husband of any creditor, whose debt is charged upon the property devised or bequeathed by the *will*, may be admitted to prove the execution thereof as an attesting witness; and that an executor of a *will* may be admitted to prove its execution, a point on which some doubts had previously existed."—*Blackstone: Comment.*, bk. ii., ch. 20.

2. *Philosophy:*

(1) Though the word *will* has often been used, as it popularly is, in two senses—the power of the mind which enables a person to choose between two courses of action, and the actual exercise of that power—strict reasoners separate these meanings, calling the former *will* and the latter *volition*. *Will* in this limited sense is that mental power or faculty by which, of two or more objects of desire or courses of action presented to it, it chooses one, rejecting the other or others. To what extent this power of selection is arbitrary, or is the result of necessity, has been for ages a subject of controversy. [Free-will.] The division of the mental powers which came down from antiquity, and was most generally adopted by philosophers, was into the powers belonging to the understanding, and those belonging to the *will*. Reid adopted it, though considering it not quite logical. "Under the *will*," he says, "we comprehend our active powers, and all that lead to action or influence the mind to act, such as appetites, passions, affections." (*Essays on the Intellectual Powers of Man*, essay 1, ch. ii., § 1, 2.) Brown denounced this classification as very illogical, considering that the *will* was not in any way opposed to the intellect, but exercised in the intellectual department an empire almost as wide as in that which was allotted to itself. "We reason," he says, "and plan and invent, at least as voluntarily as we esteem or hate, or hope or fear" (*Philosophy of the Human Mind*, sect. xvi.). The term Active Powers used by Reid is a synonym for the *will*.

(2) The conception of *will* is taken by Schopenhauer (1788–1860) in a far broader sense than that given to it by common usage. He includes in it not only conscious desire, but also unconscious instinct, and the forces which manifest themselves in inorganic nature. As intermediate between the one universal Will and the individuals in which it appears, he posits, following the example of Plato, various ideas, which are the stages of the objectification of will. His ethical requirements are sympathy with the suffering which is connected with all objectifications of the will to live, and the mortification, not of life, but rather of the will to live, through asceticism. The world, in his system, is the worst of all possible worlds; sympathy alleviates suffering, while asceticism destroys it by destroying the will to live, in the midst of life. In its negation of the sensuous nature in man, without positive determination of the true end of spiritual life, Schopenhauer's teaching resembles the Buddhist doctrine of Nirvana. (*Ueberweg.*)

¶ (1) *At will:* At pleasure: as, To hold an estate or office *at will*, i.e., to enjoy the possession during the pleasure of another, and to be liable to be ousted at any time by him.

* **5.** To desire or wish to produce or cause; to be anxious for.

6. To dispose of by testament; to give as a legacy; to bequeath.

¶ In the two following uses directly from the noun. [Will, 2.]

C. *As an auxiliary verb:*

1. A word denoting either simple futurity or futurity combined with volition, according to the subject of the verb.

"I am your wife, if you *will* marry me."
Shakesp.: Tempest, iii. 1.

(1) In the first person singular and plural, I (we) *will*, the verb denotes willingness, consent, intention, determination, or fixed purpose, thus differing from *shall*, which in the first person denotes simple futurity: as, I *will* go, if you wish it, I *will* speak, if I please. (2) In the second and third persons, *will* denotes simple futurity or certainty, the idea of volition, purpose, or wish being lost: as, He *will* certainly come.

2. *Would* stands in the same relation to *will* as *should* to *shall*, and is mainly employed in subjunctive, conditional, or optative senses, in the last case having often the functions and force of an independent verb: as,

(1) *Subjunctive* or *conditional:*

"Backward she thrust him as she *would* be thrust."
Shakesp.: Venus & Adonis, 41.

(2) *Optative:*

"I *would* my valiant master would destroy thee."—*Shakesp.: Tempest*, iii. 2.

(3) Also used, by omission of the pronoun, as an exclamation of wish, prayer, or desire.

"*Would* to God we had died in Egypt."—*Exodus* xvi. 3.

¶ In such sentences as, *It would seem, It would appear*, &c., *would* retains almost nothing of conditionality, having merely the effect of softening a direct statement. *Would* sometimes is used to express a habit or custom: as, He *would* read all day. In such sentences as, He *would* go, and you see the result, *would* has nearly the force of a simple past indicative, but is more emphatic. *Will* and *would* were formerly used elliptically with adverbs and prepositional phrases to express motion or change of place, where we should now say *will go, would go*, or the like.

"I'll never to sea again."
Shakesp.: Merry Wives, ii. 1.

A similar elliptical use occurs in such phrases as: What *would* you? = What would you have, do, or wish?

I. *Ordinary Language:*

1. *Lit. & Bot.:* Any species of the genus Salix (q.v.). Used also in a more limited sense for any Salix which is not known as an osier or a sallow. [Osier, Sallow.] Some of the willows in the limited sense furnish good timber. The Bedford willow, *Salix Russelliana*, a variety of *S. fragilis*, the Crack Willow or Withy, is a tree sometimes attaining fifty feet in height, and twelve in girth. It was first brought into notice by the Duke of Bedford, whence its name, and is very valuable for its timber, the bark containing much tannin, and a larger amount of salicine (q.v.) than any other of the genus. Another valuable timber tree is *S. alba*, the Huntingdon or White Willow. It is eighty feet high, with a girth of twenty feet. The timber is used for carpentry and for fuel, and the bark for tanning. The two species named have been introduced into the United States, where they are wide-spread and, with *S. babylonica*, the Weeping Willow, form our largest willows. There are a number of species native to this country, most of them shrubs or small trees, some minute plants. [Salix.]

The Willow-wren generally arrives in England about the middle of April, and soon after begins to couple. The nest is placed on the ground, most commonly against a bank amongst long grass or weeds, but often at the foot of a bush, and, like that of the Wood-wren, is covered with a dome having a rather wide hole in the side, whence this species and its congeners are called in many parts of the country "Oven-birds." II. *Meteor.:* A current of air moving in the ... in any direction or with any velocity. ... s are produced by variations of ... re in different latitudes, or at different ... rtions of the same latitude. Heated ... expand, and, to prevent a void from arising ... lower portion of the atmosphere fr... t has ascended, a current ... d therefore denser, takes its ... phenomenon is most obvious in ..., from which hot rarefied air is ... g, one part to.wards the Northern, and the other towards the Southern Pole. From these two regions, cold currents of air proceed near the surface of the ground or the ocean to supply the threatened void. Were the earth at rest, the hot currents would depart from, and the cold currents strike the equator at right angles, but owing to the rotation of the earth from west to east, more quickly than its friction can carry the atmosphere with it, the latter is somewhat deflected to the westward, the hot current leaving and the cold one striking the equatorial line at an oblique instead of a right angle. As the circles to be traversed by the rotating sphere or spheroid vary in magnitude in every latitude, cyclones tend to be generated which rotate in one direction, when they arise to the north, and in another when they are generated south of the equator. [Cyclone.] The heat of the vertical or nearly vertical sun rarefies the atmosphere in the tropics over both land and water, not, however, to the same extent. Land is easily heated during the day and cooled during the night. Water is less easily changed in temperature, hence every tropical island is like a separate furnace, at work during the day rarefying the air and sending it upwards, whilst, falling below the temperature of the ocean during the night, it modifies, suspends, or reverses the process, especially if the absence of clouds make radiation great. Hence, land and sea breezes arise; the former blowing during the day from the sea to the land, the latter during the night in a contrary direction. Next, every high mountain is a refrigerating apparatus, capable of sending down its slope cooled air on all its sides, and consequently from every point of the compass. Even apart from these local complications, the higher the heated air which ascends from the tropics rises, the colder the atmospheric region into which it enters; it therefore ultimately parts with the caloric which enabled it to ascend, and begins to fall, while the cold polar currents blowing towards the equator become heated, especially where their course is over the land, and ascend. Observation shows that in consequence of these causes, there are eight principal directions in which winds blow: from the north, the north-east, the east, the south-east, the south, the south-west, the west, and the north-west. A north wind is one which blows from the north, not one blowing to that region, and so with the others. Classified according to the direction in which they blow, winds are divided into Regular, Periodical, and Variable Winds. The first are winds which blow all the year round in the same direction, as the Trade Winds; the second those which blow regularly at the same seasons and the same hours of the day, as the monsoons, the land and sea breezes, and the simoom; the third, which blow sometimes in one direction and sometimes in another, as the prevalent winds of the temperate and arctic zones. The direction of the wind is easily ascertained by a vane. The average velocity of the winds in most countries may be considered as about eighteen to twenty feet in a second, if the velocity ... six or seven feet the wind is ... if ... it is fresh, ... if ... it is strong, if mighty or ... it is a ... if ninety or over it is a hurr...

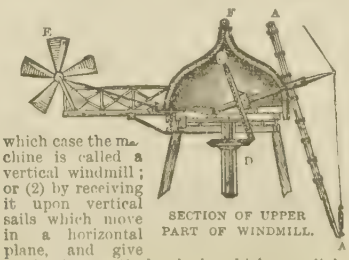
wind'-mill, * **wind-mulle,** * **wynd-mylle,** *s.* [Eng. *wind* (1), *s.*, and *mill.*]

1. *Lit.:* A mill which receives its motion by the wind acting on sails, and which is used for grinding grain, raising or pumping water, and other purposes. When wind is employed as the first mover of machinery, it may be applied in two ways: (1) by receiving it upon sails which are nearly vertical, and which give motion to an axis nearly horizontal, in



SECTION OF UPPER PART OF WINDMILL.

which case the machine is called a vertical windmill; or (2) by receiving it upon vertical sails which move in a horizontal plane, and give motion to a vertical axis, in which case it is called a horizontal windmill. Sometimes the whole mill is made to turn upon a strong vertical post, and is then called a post mill; but more commonly the roof or head (F) only revolves, carrying with it the wind-wheel and its shaft, this weight being supported on friction rollers. In the cut, which is a section of the upper part of a vertical windmill, the sails or vanes AA are attached by the frames to the extremities of the principal axis or wind-shaft (B), which is set nearly horizontally, so that the sails revolve in a plane nearly vertical, and give motion to the driving-wheel (C), which in its turn communicates motion to the shaft (D) and the machinery connected with it. As it is necessary that the extremity of the wind-shaft must always be placed so as to point to the quarter from which the wind blows, a large vane or weather-cock (E) is placed on the side which is opposite the sails, thus turning them always to the wind. But in large mills the motion is regulated by a small supplementary wind-wheel, a pair of sails occupying the place of the vane, and situated at right angles to the principal wind-wheel. When the windmill is in its proper position with the shaft parallel to the wind, these supplementary sails do not turn; but when the wind changes they are immediately brought into action, and, by turning a series of wheel-work, they gradually bring round the head to its proper position On account of the inconstant nature of the motion of the wind, it is necessary to make some provision for accommodating the resistance of the sails to the degree of violence with which the wind blows. This is done by clothing and unclothing the sails; that is, by covering with canvas or thin boards a greater or smaller portion of the frame of the sails according to the force of the wind.

II. *Technically:*

1. *Chem.:* The fermented juice of the grape. The must or expressed juice of the grapes has a density of from 1065·0 to 1154·0, and contains from 15 to 33 per cent. of sugar. It developes within itself the yeast necessary for the fermentative process, and the action is allowed to proceed until nearly all the sugar has been changed into alcohol and carbonic anhydride. The stronger wines, such as sherry and port, are nearly always fortified for foreign markets by the addition of refined alcohol. The term wine is also applied to various fermented extracts of fruit—*e.g.*, currant and elderberry wines. Besides alcohol, wine contains sugar, bitartrate of potash, odoriferous matter, with small quantities of tannin, gum, acetic and malic acids, lime, &c. The specific gravity of wine varies from ·970 to 1·045. The proportion of alcohol in wine varies from about 16·20 per cent. in port to 9·80 per cent. in claret. Wine is largely produced in several countries of Europe, particularly France, Spain, Italy, Germany, and Austria. The United States product has grown to be important, California in particular having become a large wine producer, though the product here is small as compared with that of European countries.

A. & **B.** *As pr. par. & particip. adj.:* (See the verb).

C. *As substantive:*

1. *Lit.:* The act or process of drawing metal into wire. The metal to be extended is first hammered into a bar or rod. The rods, from ½ to ¼ inch in diameter, received from the rolling-mills in bundles, are heated and re-rolled in grooved rollers, one above the other, so that the rod runs from the first roll to the second, and so on, without reheating. The rollers run with great rapidity, reducing the rod to a coarse wire, which is then passed through the successive holes in the draw-plate, a flat piece of hard steel having holes corresponding to the various numbers or sizes of wire. The best are made of a combined plate of highly-tempered steel and wrought-iron. The holes are tapering, the smallest opening being on the steel side through which the wire first enters. [DRAW-PLATE.] Very fine gold and platinum wires, used for the spider-lines of telescopes, are formed by coating the metal with silver, which is then drawn down to a great tenuity, after which the silver coating is removed by nitric acid, leaving an almost invisible interior wire, which has been so attenuated that a mile in length weighed only a grain. Wiredrawing seems to have arisen at Augsburg or Nuremberg in the fourteenth century. In 1463 and 1484 the importation of iron wire into England was prohibited. The manufacture was soon after attempted in England, but did not make much progress till a patent was granted, in 1565, to certain Dutchmen and Germans to carry it and some other processes out. The United States has grown to be one of the leading wire-producing countries.

wīre'-wŏrm, *s.* [Eng. *wire*, and *worm.*] [See def.]

Entom. & Agric.: The name given by farmers and others to a kind of vermiform larva, long, slender, cylindrical, and somewhat rigid. Most wireworms are the larvæ of the Elateridæ. Some live in rotten stumps of trees, others gnaw roots of kitchen garden and other plants, cereals, grass on lawns, &c. Some of them live in the larva state for three years. One of the most common wireworms is the larva of *Cataphagus sputator.* The last segment of the body is long, entire, and wire-like. It is believed that the form of this species suggested the prefix wire in the name wireworm. It attacks the roots of lettuces, eating them as far as the collar, with the effect of killing the plant. *Agriotes lineatus* similarly devours the roots of the oat, causing the leaves to wither and the plant to die. The larva of *Hemirhipus segetis* feeds on the roots of plants with the same destructive effect. The rook, the domestic fowl, and the mole are natural foes of the wireworms. The name is sometimes applied to the Iulidæ.

Spenser: Ruines of Time, 10.

2. Lean but sinewy; tough.

"Mounted on *wiry* station horses."—*Globe*, March 25, 1868.

wĭs, *adv.* [See def.] A fictitious verb given in many dictionaries, with a pa. t. *wist*, and with the meanings to know, to be aware, to think, &c. The mistake arose from the adverb *iwis, ywis* = certainly, in which the prefix (like most other prefixes) was frequently written apart from the rest of the word, and not infrequently the *i* was represented by a capital *I*, so that it appeared as *I wis.* Hence the *I* has been mistaken for the first personal pronoun, and the verb *wis* created. [YWIS.]

wis-alls, wis-omes, *s.* [Etym. doubtful.] The leaves and tops of carrots and parsnips. (*Prov.*)

wĭz'-ard, *s.* [WIZARD.]

wĭz'-dŏm, * **wis-dam,** * **wys-dome,** * **wyse-dome,** *s.* [A.S. *wisdóm*, from *wis* = wise, and suff. *-dóm* = Eng. *doom* = judgment; Icel. *visdómr;* Sw. *visdom;* Dan. *visdom, visdom.*]

(It is often nearly synonymous with *discretion, sagacity*, or *prudence*, and frequently it implies little more than sound common-sense, perfect soundness of mind or intellect, and hence is often opposed to *folly.*)

¶ (1) *The Wisdom of Solomon:*

Apocrypha: An apocryphal book, named in Gr. Σοφία Σαλωμών (*Sophia Salōmōn*), or Σαλομῶντος (*Salomōntos*), generally placed sixth in order between "the rest of Esther" and Ecclesiasticus. Its author professes that he is a king (vii. 1-6; ix. 7), and son of a worthy father, also a king (12). He himself prayed to God for wisdom and received it, wealth being superadded (vii. 7-13). God directed him to build a temple on the holy mount on the model of the Tabernacle (ix. 8.), from all which it is obvious that the author claims to be Solomon, the son of David, King of Israel. The book is now divided into nineteen chapters. The first of these exhorts judges to love righteousness, and commends wisdom to them and others. The second denounces the unbelief of the ungodly, and traces to this source the wickedness of their lives. The third, fourth, and fifth point out that for the righteous there is a happy future, whilst an opposite destiny awaits the wicked. Chapters vi.-ix. highly commend wisdom. Portions of them resemble corresponding exhortations and descriptions in the Books of Proverbs (cf. Wisd. vi. 12-15 with Prov. viii. 17-21; ix. 9 with Prov. viii. 25-30). The advantages of wisdom are shown in chapters x.-xii. by illustrations taken from the history recorded in the Pentateuch (it is remarkable that the author adds no more modern examples). In chapters xiii.-xv. the folly of idolatry is exhibited in language of great beauty and force, and a philosophic explanation of its origin is attempted. (Cf. Wisd. xiii. 11-16 with Isaiah xliv. 12-20). The last four chapters contrast the providence which watches over the wise and the pious with the judgments which overtake idolaters and the ungodly, historical illustrations, as before, being derived solely from the Mosaic writings. Though the book is called "The Wisdom of Solomon," there is no reason to believe that he was its author. It was composed originally in Greek, probably by some Jew resident in Alexandria. It incorporates words from the Septuagint version of Isaiah iii. 10, xliv. 20 (circ. B.C. 284-246), and therefore was subsequent to that date. The Apostle Paul was evidently acquainted with this book (cf. Wisd. xiv. 21-27 with Rom. i. 19-32; Wisd. xv. 7 with Rom. ix. 21; Wisd. ix. 15 with 1 Cor. xv. 53, and 2 Cor. v. 1, and Wisd. v. 17-20 with Ephes. vi. 11-17). It is not influenced by Philo (B.C. 20 to A.D. 40 (?), and in all likelihood was earlier than his era. Its more probable date was B.C. 150 to 50, or more approximately B.C. 120 to 80. If these dates are nearly correct, then Wisdom is the most ancient Jewish book except Daniel (xii. 2, 3), in which the doctrine of rewards and punishments in a future state is clearly set forth; but it differs from Daniel in teaching the immortality of the soul, without reference to the resurrection of the body. It is the first book which identifies the serpent which tempted Eve with the Devil (cf. Wisd. ii. 24 with Gen. iii. 1-5, 14, John viii. 44, and Rev. xii. 9, xx. 10). No one can study the Book of Wisdom without entertaining high respect for its author, and deriving profit from his ethical teachings. For thoughtful and beautiful sentiments see i. 4, 6; iv. 8, 9; vi. 18; xvii. 11, 12, &c.

Allied to *witan* = to see (pa. t. *wite,* pl. *witon*). It is clear that *ic wát* is really an old past tense (prob. of *witan*), used as a present, causing the necessity of creating a new past tense, *wisse,* or *wiste* which is, however, of great antiquity . . . The gerund is *tó witanne,* whence Mod. "True *wit* is nature to advantage dress'd.
What oft was thought, but ne'er so well exprest."
Pope: Essay on Criticism, ii. 97.

¶ Perhaps the clearest definition of wit would be, that it is a combination of ideas which creates a feeling of surprise at the unexpected congruity of things apparently incongruous. Hence it would seem to be the power of comparison that creates wit; but there are many unexpected combinations of this character, which, as Sydney Smith justly observes, would be witty if they were not sublime or beautiful. A strong sense of grandeur or beauty overpowers or takes away the sense of wit. He instances the idea in Campbell's *Lochiel*—"Coming events cast their shadows before"—which, as he remarks, would be witty if it were not sublime. The awe and reverence awakened by the highest subjects connected with our faith also destroy the impression of wit; but in the works of many of our most eminent religious writers, and even in the Scriptures, may be found happy combinations, which, but for the sanctity of the subject, would awaken the sense of wit. An unexpected fitness, then, seems to form the essence of wit; and as the same writer we have referred to observes, among the uneducated and children the same kind of feeling is often awakened by a combination of things as well as of thoughts, such as the putting together of a puzzle. (*Trench: Synonyms.*)

8. One who has genius, fancy, or humour; a person of learning and refined ideas; an accomplished scholar.

wĭtch'-craft, * witche-craft, *s.* [A.S. *wiccecræft*, from *wicce* = a witch, and *craft* = craft, art.]

1. The practices of witches; a supernatural power which persons were formerly supposed to obtain by entering into a compact with the devil. The compact was sometimes express, whether oral or written, when the witch abjured God and Christ, and dedicated herself wholly to the evil one; or only implied, when she actually engaged in his service, practised infernal arts, and renounced the sacraments of the church. The express compact was sometimes solemnly confirmed at a general meeting, at which the devil presided, and sometimes privately made by the witch signing the articles of agreement with her own blood, or by the devil writing her name in his "black book." The contract was sometimes of indefinite duration, at other times for a certain number of years. The witch was bound to be obedient to the devil in everything, while the other party to the act delivered to the witch an imp, or familiar spirit, to be ready at call and to do whatever was directed. [FLY, *s.*, I. 1. (5), ¶.] He further engaged that they should want for nothing, and be able to assume whatever shape they pleased to visit and torment their enemies and accomplish their infernal ends. The belief in witchcraft is of great antiquity. The punishment for witchcraft was death, generally by burning. The number of people put to death in England has been estimated at about 30,000. Statutes were passed against witchcraft in the reigns of Henry VI., Henry VII. (1541), Elizabeth (1563), and James I. (1604). During the sitting of the Long Parliament 3,000 persons are said to have been executed on the charge of witchcraft. Judicial convictions were checked chiefly by the firmness of Judge Holt, who in about ten trials, from 1694 to 1701, charged the juries in such a manner as to cause them to bring in verdicts of acquittal. The first law against witchcraft in Scotland was passed in 1563. The last victims in England were Mrs. Hickes and her daughter nine years of age, executed in 1716, and the last in Scotland suffered in 1722. The prosecution of supposed witches was by no means confined to England. All Europe was infected with the delusion, and it is estimated that not less than 300,000 persons were executed as witches during the prevalence of this epidemic of superstition, which for several centuries afflicted Europe. The last judicial victim of the delusion was a servant girl at Glarus, in German Switzerland, who was put to death for witchcraft in 1782. This country did not quite escape the epidemic, though fortunately its share in it was a small one. The Salem Witchcraft persecution, under which nineteen executions took place in 1691–92, was the most deplorable outbreak of the cruelty of superstition which the territory of the United States has ever known. An execution for witchcraft had taken place in New England as early as 1648, but after the reaction in public opinion which began in 1693, this shameful delusion came to an end, so far as persons in authority were concerned. The most absurd ideas were entertained by the believers in witchcraft. Witches, they held, with the aid of the devil, could produce mice and vermin, rob men of their powers by a touch or a breath, raise storms, foretell events, change themselves into cats and other animals, and perform other magical feats. [WALPURGIS-NIGHT.]

They formed the highest court of judicature in the kingdom, and their concurrence was necessary to give validity to laws, and treaties with foreign states. ¶ *By, with,* and *through* are closely allied in many of their uses, and it is difficult to lay down a rule by which their uses may be distinguished. For the difference between *with* and *by,* see BY. Trench (*Synonyms*) further discriminates between them as follows:

"Whenever a certain effect is implied as proceeding from two causes, the remote and original cause is expressed by the use of *by,* and the immediate one by *with.* For instance: The tree was cut down *by* a woodman *with* an axe. If we said, *by* an axe, it would imply some free agency on the part of the axe. *With* a woodman, on the other hand, would imply that the woodman was an unconscious instrument in the tree's destruction. On the other hand, whenever a conscious agent is implied, we use the word *by.* In general, *with* is improper, not only when a conscious agent is supposed, but when the agent is personified to a certain degree in our own minds, from its action being apparently voluntary. *By* and *with* are often used when no agent is spoken of, but a certain object is said to be accomplished by certain means. But in this case, *by* implies that the means used are essential; *with,* only that they are useful in aiding our endeavours. *Through* is somewhat different from the other words mentioned. It often implies that the means used are the appointed channels for the conveyance of the object or advantage specified; as, I heard the news *through* such a person; I received a remittance *through* the bank."

(1) A term applied to the harsh, howling sound of certain chords of keyed instruments, particularly the organ, when tuned by any form of unequal temperament.

(2) A wolf-note (q.v.).

3. *Zool.: Canis lupus,* of which there are many varieties, by some authorities raised to specific rank, but the differences between them are slight and unimportant, and probably produced by climate and surroundings. The Common Wolf is about five feet from the snout to the tip of the tail, which is about twenty inches long; height at shoulder about thirty-two inches; hair dark yellowish-gray, sometimes almost black, long and coarse in the northern varieties, and shorter in those which are found in warm climates; tail drooping; ears upright and pointed; eyes set obliquely. The wolf is swift, and preys on sheep and calves, associating in packs to run down deer and other animals; rarely attacking man unless hard pressed by hunger, when it becomes very dangerous. The geographical range is very wide, and it is common in Europe, though it has been extinct in England since the end of the fifteenth century. The last wolf is said to have been killed in Scotland by Sir Ewen Cameron, in 1680, and wolves lingered in Ireland for at least thirty years later. Of the other varieties the chief are the Black Wolf of Southern Europe; the Indian Wolf (*C. pallipes*); the White Wolf (*C. laniger*) and a variety with black shaggy fur (*C. niger*), from Tibet; the North American Wolf (*C. occidentalis* = *Lupus griseus*), differing chiefly from the Common Wolf in having finer, denser, and longer fur, and very broad feet, enabling it to travel easily over the snow; the White Wolf (*Lupus albus*), the Pied Wolf (*L. sticte*), the Dusky Wolf (*L. nubilus*); and the Black Wolf (*L. ater*), all from North America. [Red-wolf.] The Prairie-wolf, or Coyote *Canis latrans*), found from Mexico northwards to the Saskatchewan, is probably a distinct species. It is much smaller than the Common Wolf, the body and head together measuring only about three feet, and the tail some fifteen inches; colour dull yellowish-gray, clouded with black. They hunt in packs, and can utter a short, snapping bark, while the only sound made by true wolves is a prolonged howl.

Wolfian-theory or **hypothesis,** *s.*

Historic criticism: A theory or hypothesis published by Fredrich August Wolf (1759–1824), the most distinguished German classical

scholar of his time, in the Prolegomena to his second edition of Homer, sent forth in 1794 or 1795, to the effect that not merely were the *Iliad* and *Odyssey* composed by different poets, but that each of these compositions was put together from ballads preserved in the memory of itinerant minstrels or rhapsodists before writing was known in Greece, the poems taking their present form after writing was introduced in the sixth century B.C. Wolf's views attained to great celebrity, and an effort on the part of Heyne to claim priority in their discovery failed of effect. They not merely affected Homeric and other historic criticism permanently, but gave an impulse to the rationalistic treatment of Scripture which has not yet passed away. [CHORIZONTES.]

Wolff'-ĭ-an-ĭsm, Wolf'-ĭ-an-ĭsm, *s.* [Eng. *Wolffian* (i), *Wolfian*; *-ism.*]

Philos.: The system developed from Leibnitzianism (q.v.), by Christian Wolff. [WOLFFIAN, A.] He appropriated the conceptions of Leibnitz, and, modifying them to some extent, brought them into nearer agreement with the ordinary conceptions of things. He denied perceptions to all monads which were not souls [MONAD, I.], accepted the doctrine of pre-established harmony only as a permissible hypothesis, and refused to exclude the possibility of the interaction of soul and body. He divided metaphysics into ontology (treating of the existent in general), rational psychology (of the soul as a simple, non-extended substance), cosmology (dealing with the world as a whole), and rational theology (treating of the existence and attributes of God). His moral principle was the idea of perfection; and he taught that to labour for our own perfection and that of others is the law of our rational nature.

women (as **wĭm'-mĭn**), *s. pl.* [Woman.]

women's rights, *s. pl.* The name given to the claims advanced on behalf of women who demand that their sex shall, as far as possible, be put on a footing of legal and social equality with men. The agitation for women's rights dates from the middle of the present century, and has been most active within the United States and Britain, in which countries its progress has been very considerable. Women claim the right of suffrage, on the ground that they pay taxes for their property, and have an equal claim with man to a voice in making the laws ; they desire to share with men the higher educational opportunities, to enter trades and professions on the same terms with men, to have equal control of their property and children, and to have a voice in making the laws of marriage and divorce, which, they say, press with unequal severity upon them. Many of these demands have been accorded them, and it seems as if before many years all would be. As regards suffrage, in one of the states of this country, Wyoming, women have full suffrage, and in many of the states partial suffrage. In England they possess the municipal, and may soon gain the parliamentary suffrage.

II. *Technically:*

1. *Art:* [WOOD-ENGRAVING].

2. *Bot., Veget. Physiol., &c.:* Botanists use the term wood in two senses: first, the portion of the stem and branches which intervenes between the pith and the bark, without reference to whether it is hard or soft; and second, the hard portion of the stem and branches of a tree or shrub, the soft substance existing in similar situations in an herb being denied the name of wood. No wood exists in the embryo of an exogen, which at the outset consists wholly of cellular tissue. Soon after it has germinated, however, fine ligneous fibres descend from the cotyledons to the radicle, meeting in the centre of the embryo, and constituting a fine ligneous axis. Somewhat similarly, each leaf, after the tree or shrub has grown, sends down elaborated sap, which forms a layer, sheath, or ring of cambium inside the bark. [CAMBIUM.] The cambium layer generates fibro-vascular bundles, the inner portion being woody [XYLEM] and the outer portion less solid. [BAST, PHLOEM.] At first the bundles are separate from each other, but ultimately they unite and constitute a hollow cylinder around the central pith. This process continuing, especially in spring, new wood is added around the old, and being softer than that previously existing, is called alburnum or sap-wood, the other being denominated duramen, or heart-wood (q.v.). The intermission of growth in winter leaves a circular mark on the stem, well seen in a cross section, thus giving rise to a series of annual zones. [ZONE.] Exogenous wood is traversed by medullary rays (q.v.). In woody endogens, such as palms, there is no proper cambium layer, nor is there a central pith, but the fibro-vascular bundles are separated from each other, and may be seen on a cross section scattered irregularly over the whole breadth of the stem, but more numerous, closer together, and harder near the circumference than towards the centre. In the stems of the woody acrogens (Tree-ferns) there is a circle of fibro-vascular bundles not far from the exterior of the stem. The cross-section shews these to be, as a rule, united in pairs. [FOSSIL-WOOD, SILICIFIED-WOOD.]

¶ The preservation of the forests of the United States has been a much-mooted question of recent years, the rapid felling of trees rendering it probable that the woodland would all disappear unless active measures were taken to preserve it. Many of the states now have Forestry Associations, and a National Forestry Congress has been held which did much to call attention to the importance of this subject. The turning point has perhaps been reached, and the rapid destruction of the woodland promises to be checked.

4. *Music (Pl.):* That class of wind-instruments constructed of wood, ivory, or the like, the principal of which are the flutes, oboes, clarinets, bassoons, &c., in contradistinction to the strings and brass.

A viscous solution of gelatine mixed with a small proportion of a pigment or dye is next poured over the mould, and a sheet of strongly sized paper placed on top and firmly squeezed. On carefully removing the paper a perfect impression is obtained, and this is fixed by immersing in a strong solution of alum. Any number of copies may be obtained from the same mould.

1. *Ornith. : Scolopax rusticula* (the *rusticola* of Linnæus is a misscript; cf. *Pliny : N. H.*, x. 54, in some editions 38); distributed over Europe, the north of Asia, and as far East as Japan, but not found in the United States or any part of North America, where it is replaced by a woodcock of different genus. The Woodcock is about thirteen inches long; upper surface varied with ruddy, yellowish, and ash tints, and marked with great black spots; lower parts yellowish-red with brown zigzags; quills striped with red and black on their external barbs, tail-feathers terminated above with gray and below with white. The female is rather larger and stouter than the male. One of the most interesting traits about the Woodcock is the fact of its occasionally conveying its young through the air; which is done by only one or two other birds. The fact was known in the middle of the eighteenth century; but White (lett. xxxi., to Pennant) rightly surmised that Scopoli erred in supposing that the young one was conveyed either by or in the bill. It is just as erroneous, however, to substitute the claws, as some have done, for the bill. When the parent bird wishes to convey her young one from a place of danger to one of safety, the tiny thing is gently pressed between the feet and against the breast, the aid of the bill only being resorted to when the burden has been hastily taken up. The American Woodcock, *Philohela minor*, is a smaller bird, but resembles the European species in plumage and habit, and, like it, is esteemed for the table.

¶ When Athens was in imminent danger from the Persians, 483 B.C., during the invasion of Xerxes, the oracle at Delphi was consulted, and, intimating that the city and country were doomed to ruin, added that—when all was lost, a wooden wall should still shelter her citizens. The Athenian young men interpreted "a wooden wall" to signify ships; Themistocles, who had probably influenced the oracle to utter the prediction or counsel it had given, was of the same opinion; faith was put in the navy, and the result was the great victory of Salamis. It was from this incident that the expression, "The wooden walls of England," arose.

It yields a gum like gum-tragacanth. The flowers, with alum for a mordant, give a red dye, occasionally used in India for silk. The leaves and flowers, together with the bark of *Zizyphus xylopyra*, are employed in tanning. Medicinally the dried flowers are stimulant and astringent; they are used by Hindoo doctors simply in bowel complaints, with curdled milk in dysentery, and with honey in menorrhagia, also as an external application in hæmorrhages and in ulcers.

wood'-pĕck-ẽr, *s.* [Eng. *wood* (1), s., and *pecker.*]

Ornith.: The popular name of the old Linnæan genus Picus, now greatly divided. Woodpeckers have a slender body, powerful beak, and protrusile tongue, which is sharp, barbed, and pointed, and covered with a glutinous secretion derived from glands in the throat, this coating being renewed every time the tongue is drawn within the bill. The tail is stiff, and serves as a support when the birds are clinging to the branches or stems of trees. The plumage is generally of strongly contrasted colours, black and white, or green and yellow, with red marks about the head. Woodpeckers are very widely distributed, but abound chiefly in warm climates. They are solitary in habit, and live in the depths of forests. Fruits, seeds, and insects constitute their food, and in pursuit of the latter they exhibit wonderful dexterity, climbing with astonishing quickness on the trunks and branches of trees, and when, by tapping with their bills, a rotten place has been discovered, they dig vigorously in search of the grubs or larvæ beneath the bark. The common notion that they are injurious to trees is erroneous, as they do more good by preventing the ravages of insects than harm by their pecking. They roost and breed in hollow trunks, or holes in trees, enlarged by their strong, sharp bills; the eggs, which are white, smooth, and glossy, vary considerably in number, and are deposited on a bed of chips at the bottom of the hole. There are numerous American species, including the Flickers of the United States, the South American Ground Flickers, and the great Ivory-billed Woodpecker of the Southern States.

wood'-pĭg-eŏn, *s.* [Eng. *wood* (1), s., and *pigeon.*]

Ornithology:

1. *Columba palumbus*, a well-known bird common in the British Isles and distributed generally over Europe. Length about seventeen or eighteen inches; head, chin, and part of neck blue-gray, rest of neck and breast purple-red; bare skin at base of bill nearly white; feathers on side of neck tipped with white so as to form portions of oblique rings; upper parts and wings slaty bluish-gray; plumage of hen less brilliant. Varieties more or less spotted with white often occur, and perfect albinos are sometimes met with. The food of the Woodpigeon consists of corn and grain, beechmast, peas, tares, acorns, the young shoots of turnip-tops, and spring-sown corn; and, as these birds make no return to the farmer by destroying his insect foes, their rapid increase is a source of grave anxiety to agriculturists. The nest of the Woodpigeon is a mere platform of loose sticks, so carelessly constructed that eggs and young birds are often blown therefrom and destroyed. The eggs are always two in number, white and oval; two and sometimes three broods are produced in the year. The ordinary flight is very strong and rapid, and, if disturbed, the bird springs into the air with a peculiar flapping of the wings, which may be heard at a considerable distance.

* 2. *Columba œnas.*

"As to the wild *woodpigeon*, the *Œnas*, or *Vinago*, of Ray, I am much of your mind; and see no reason for making it the origin of the common house dove: but suppose those that have advanced that opinion may have been misled by another appellation often given to the *Œnas*, which is that of stock-dove."—*White: Selborne*, lett. xliv. wool, * **wol,** * **wolle,** * **wulle,** * **woule,** *s.* [A.S. *wull*, *wul*; cogn. with Dut. *wol*; Icel. *ull* (for *vull*); Dan. *uld*; Sw. *ull*; O. H. Ger. *wolla*; Ger. *wolle*; Goth. *wulla*; Lith. *wilna*; Russ. *volna*; Sansc. *úrná* = wool; Lat. *villus* = shaggy hair; *vellus* = a fleece; Gr. ἔριον, εἶρος (*erion*, *eiros*) = wool.]

1. The fleece of the sheep; the soft hair which grows on sheep and some other animals, as the alpaca, the vicugna, some species of goats, &c., which in fineness somewhat approaches to fur. The distinction between wool and hair is not radical, one being but a modification of the other. Wool is softer, more curled and twisted, and more flexible than hair, and possesses in a much greater degree the remarkable property of felting. The wool of the same animal differs much on the various parts of the body: that on the back, shoulders, and sides is the best. According to its quality wool is divided into different sorts, which receive different names. A threefold classification into primes, seconds, and thirds is pretty general in this country; but sometimes the wool of a single fleece is divided into as many as ten sorts. Wool is also divided into two classes, known as short or carding wool, which seldom exceeds three or four inches in length, and long or combing wool, varying in length from four to eight inches. The finest wools are of short staple, and the coarser wools usually of long staple. English-bred sheep produce a good, strong combing wool, that of the Scotch breed is somewhat harsher and coarser. The Saxon merinos have long been considered the most valuable in point of fineness of fibre. The wool of the alpaca is superior to the wool of English sheep in length, softness, and pliability, and is used for many purposes for which silk was formerly used. The wool of the llama is shorter and more rough. The chief supply of imported wool for manufacturing purposes is obtained from Australia, South America, and some European countries.

¶ During the reign of Edward I. a duty was imposed on the exportation of British wool, and, after some vicissitudes of taxation, its despatch to foreign countries was absolutely prohibited in 1660, the idea being entertained that the wool of England was superior to any obtained abroad, and that if the raw material were kept at home the world would be obliged to take the finished manufacture. In 1825 the restriction was swept away, with the usual result of aiding rather than impeding the prosperity of the woollen manufacture (q.v.).

2. Less strictly applied to some other kinds of hair, and especially to short, thick hair, crisp and curled, like the hair of a negro.

"In the cauldron boil and bake;
Eye of newt and toe of frog,
Wool of bat and tongue of dog."
Shakesp.: Macbeth, iv. 1.

"Half a dozen *wool-combers*, perhaps, are necessary to keep a thousand spinners and weavers at work."—*Smith: Wealth of Nations*, bk. i., ch. x.

wool-combing, *s.* The act or process of combing wool, generally of the long stapled kind, for the purpose of worsted manufacture. The wool-combing machine separates the long from the short fibres of the wool. The long fibres are also laid in regular order, so that they can be readily spun into yarn. Lister's apparatus clears the long fibres by drawing them through a series of teeth by means of a nipper. A pair of jaws seizes a mouthful of wool, and conveys it into a carrier, which, in its turn, deposits upon the comb a brush, pressing it down on the teeth to a proper depth. Having cleared one end of the staple, it transfers the uncleared end to the rotating comb, from which it is extracted by drawing-rollers. The noils are removed from the comb by another set of rollers. The long, cleared wool is delivered in a continuous sliver from the machine at one point, the noil being passed away at another.

woollen-manufacture, *s.* The act of forming wool into cloth and stuff. The fabrics woven from short wools are distinctively called woollens; those from long wools are termed worsteds. [WORSTED.] The manufacture of cloth was known to the ancient Greeks, Romans, the Hindoos, the Jews, &c. (Lev. xiii. 47, 48, xix. 19; Deut. xxii. 11), but among these people it was chiefly a domestic manufacture. In all probability the Romans first introduced it into Britain. There is little historic mention of it before the thirteenth century. Edward III. improved the manufacture by inviting over Flemings, who were more skilful in it than the English of that time. During subsequent centuries unwise legislation, such as limiting the industry to particular towns, retarded its progress; besides which it was hampered by enactments equally unenlightened regarding wool. [WOOL, ¶.] It has now become one of the leading industries of England, and has attained a great development in the United States, in which country, in addition to the home supply of wool, 103,000,000 pounds were imported in 1890, for use in manufacture. The wool produced in the United States in the same year was about 270,000,000 pounds. In addition to the home manufacture, woollen goods were imported to the value of over $40,000,000.

"In all cases in which we are accustomed to speak of *work* being done—whether by men, horse-power, or steam-power, and however various the products may be in different cases—the physical part of the process consists solely in producing or changing motion, or in keeping up motion in opposition to resistance, or in a combination of these actions."—*Atkinson: Ganot; Physics*, § 60.

2. *Min.:* Ores before they are cleaned or dressed.

3. *Script. & Theol.:* In Rom. xi. 6, work is used in the singular as opposed to grace; much more frequently the term is plural (works), and often constitutes an antithesis to faith (Rom. iii. 27). Sometimes the expression is "the works of the law" (Rom. ix. 32), also "dead works" which require to be repented of (Heb. vi. 1, ix. 14). A fundamental distinction is drawn between the works of the flesh (Gal. v. 19–21) and the fruit of the spirit (22–23). The Protestant doctrine is, that man is justified by faith made manifest by works (Rom. iii. 28, cf. James ii. 17–26) but is judged by works (Matt. xvi. 27; xxv. 31–46), those which are the fruit of faith being acceptable to God (Rom. vi. 1–23, viii. 1–4; Heb. xi. 5), those not having this origin being unacceptable (Heb. xi. 6). Cf. the twelfth, thirteenth, and fourteenth of the Thirty-nine Articles, the Confession of Faith, ch. xvi., &c. A controversy arose in the sixteenth century on the necessity of good works to salvation. Melanchthon was accustomed to admit this necessity. The more rigid Lutherans considered his views on the subject a departure from those of their master. Major, in 1552, defended Melanchthon's opinion against Nicholas Amsdorf, who maintained that good works are pernicious to salvation. Major made a partial retractation, and in 1577 the controversy was terminated by the Formula of Concord. [Formula, *s.*, ¶ (2).]

¶ *Work* is the general term, as including that which calls for the exertion of our strength: *labour* differs from it in the degree of exertion required, it is hard *work*; *toil* expresses a still higher degree of painful exertion; *drudgery* implies a mean and degrading *work*, and is the lot of those lowest in society. *Work* is more or less voluntary, but a *task* is *work* imposed by others.

2. A house in which paupers are lodged, and those of them who are able-bodied are compelled to work. Workhouses were originally erected in the reign of Charles II., in order to compel rogues and vagabonds to work for a living. They have since then become one of the essentials of the organization of nations, and have extended, in one form or other, throughout Europe, every nation of which is confronted with the problem of the incapable poor. In the United States, as in Scotland, they are usually designated poor-houses, not workhouses, as in England. Each state has its own poor laws, and each is expected to care for its own poor, a poor-tax being laid for their support. Any American who becomes a pauper loses the rights of citizenship. The Massachusetts law, which generally represents the character of the poor-law throughout the Union, provides for the erection of township poorhouses for the support and employment of all indigent persons who are a charge upon the town; of all able-bodied indigent persons who refuse to work; of all who lead a dissolute vagrant life, with no regular business; and others of the idle and vagrant class. Those able to work may be required to do so, as in a house of correction. The American system is marked by definite classification, variety of work, and liberal diet. Under English law every workhouse has to keep a register of religious creeds. The inmates of workhouses are not allowed to go out and in at pleasure, and the able-bodied are compelled to work when required. Married persons are separated, unless both are over sixty years of age. Religious and secular instruction is supplied, and wholesome food and sufficient clothing provided. The maintenance, control, and sanitary appliances of workhouses are under the control of the Poor-law Board.

II. *Technically:*

1. *Zool.:* Any individual of the phylum Vermes (q.v.). They differ greatly in outward appearance, and in habits, and very many are parasitic in other animals. They do not move by means of articulated limbs, nor is the body jointed like that of a crustacean or an insect. But whatever shape the body may assume, it is composed of incomplete segments, the majority of which are similar, and is more or less ringed externally. The segments are provided with offensive and locomotive organs on both sides, and usually with a special excretory organ opening from within. There is a water-system communicating with the perivisceral cavity and with the outside. The digestive system is often fairly developed, but in some parasites it is wanting, and these are nourished by absorption through the body walls. A kind of circulatory system is sometimes present, as are special organs of respiration, such as the branchial filaments of the Terebellidæ; but both are also often absent. The nervous system may consist of a cord round the œsophagus, with ganglia above and below, and a ganglionic cord along the ventral surface within; or there may be but faint traces of the system. Sense-organs may exist in a rudimentary condition. The organs and structures of the body are, to a great extent, the same on both sides, and hence there is bilateral symmetry.

Clearly in our modern sense of '*worship*,' this language would be inadmissible. But 'worship' or 'worthship' meant 'honour' in our early English, and 'to *worship*' to honour, this meaning of 'worship' still very harmlessly surviving in 'worshipful,' and in the title of 'your worship' addressed to the magistrate on the bench. So little was it restrained of old to the honour which man is bound to pay to God, that it is employed by Wycliffe to express the honour which God will render to his faithful servants and friends. Thus our Lord's declaration, 'If any man serve Me, him will my Father honour,' in Wycliffe's translation reads thus, 'If any man serve Me, my Father shall *worship* him.'"

wôund, * **wounde,** *s.* [A.S. *wund*, cogn. with Dut. *wond, wonde;* Icel. *und* (for *vund*); Dan. *vunde;* O. H. Ger. *wunta;* Ger. *wunde* = a wound, *wund* = wounded; Goth. *wunds* = wounded. Formed from the pa. par. of the strong verb signifying "to fight," or "suffer," represented in A.S. by *winnan* = to strive, to fight, to suffer; pa. par. *wunnen.* (Skeat.)]

1. A breach or rupture of the skin and flesh of an animal caused by violence, or, in surgical phrase, a solution of continuity in any of the soft parts of the body occasioned by external violence, and attended with a greater or less amount of bleeding. Wounds are classified as follows:

(1) Cuts, incisions, or incised wounds, produced by sharp-edged instruments.

(2) Stabs or punctured wounds, made by the thrusts of pointed weapons.

(3) Contused wounds, produced by the violent application of hard, blunt, obtuse bodies to the soft parts.

(4) Lacerated wounds, in which there is tearing or laceration, as by some rough instrument.

(5) Gunshot wounds.

(6) Poisoned wounds, wounds complicated with the introduction of some poison or venom into the part.

"Where sharp the pang, and mortal is the *wound*."
Pope: Homer; Iliad xiii. 719.

¶ Wounds which have severed only muscles and the blood-vessels and nerves connected with them heal more easily than those which affect the tendons. As a rule wounds made by a sharp weapon or instrument heal more quickly than bruises produced by the blow of a weapon which is blunt; as, for instance, a club. When an artery is severed, bright red blood is ejected by spurts; when a vein is cut, dark blood comes forth more slowly. In either case nature makes immediate efforts to repair the injury. Even in the case of an artery, the blood after a time tends to flow less freely, and an external coagulum to be formed which ultimately stops its effusion. The object of the surgeon is to stop the flow of blood, to bring together the severed portions of a vessel and keep them together till nature re-unites them, using appliances to prevent the access of the atmospheric air with its myriads of germs. In unfavourable cases tetanus results, or pyæmia, or both.

2. Any injury to the bark and wood of a tree, or of the bark and substance of other plants.

3. Any hurt, pain, or injury: as, a *wound* to credit or reputation. Especially applied to the pangs of love.

Various accounts are given of the origin of this custom, but as in Celtic mythology the wren was regarded as having brought fire from heaven for the use of man, and as somewhat similar customs exist in many other places, it is probable that this hunting the wren had once a mystic meaning in connection with the great festive season of the first twelve nights of the sun's return from the winter solstice, and that the killing of the bird was originally sacrificial.

C. *As substantive:*

1. The act or art of forming letters and characters on paper, parchment, wood, stone, or other material, for the purpose of recording ideas or of communicating them to others by visible signs.

¶ Writing may be divided into ideographic and phonographic, *i.e.*, into signs representing the things symbolized by words, and signs representing sounds—that is, words themselves. In Egyptian hieroglyphs we have ideographs and phonographs mixed together; and the same thing occurs in the Mexican picture-writing. It is generally agreed that the art of writing was introduced to the western nations by the Phœnicians about 1500 B.C. Their system was probably based on the Egyptian. The Egyptians had three distinct kinds of writing—the hieroglyphic, the hieratic, and the enchorial or demotic. (See these words.) The Greeks at first wrote from right to left; next they adopted a method called boustrophedon, from the motion of the ox in ploughing—that is, alternately from right to left, and from left to right. Writing from left to right is said to have been introduced in the time of Homer by Pronapides of Athens. In ancient Greek and Roman writing the words were not separated by spaces, and no punctuation marks were used. In mediæval MSS. a variety of styles were used in different epochs and countries, and for different uses. [Majuscule, Minuscule.] Uncial letters prevailed from the seventh to the tenth centuries. [Uncial.] The Gothic cursive was introduced about the middle of the thirteenth century. The Modern German alphabet was also introduced about the same time. The Norman style came in with the Conqueror. The English court hand, an adaptation of Saxon, prevailed from the sixteenth century to the reign of George II., when its use was legally abolished. There are no traces of writing in Britain previous to the Roman period. The Runic alphabet, used for many centuries in Denmark, Norway, and Iceland, was based on the Roman. Chinese characters are syllabic, and as Chinese words are monosyllables, they are strictly ideographic. Their system is said to contain 40,000 characters. Sanscrit possesses the most perfect known alphabet: its consonants number thirty-three and its vowel signs fourteen. It is written from left to right. [Cuneiform, Ogham, Phonetic, Runic, Shorthand.]

WRYNECK.

of the feathers; under parts buff, each feather with a narrow dark-brown spot near the tip. Little or no variation in the female. It feeds on caterpillars and other insects, and is often seen near ant-hills in search of the cocoons, popularly known as "ant's eggs." The construction of the protrusile tongue resembles that of the woodpecker, and the organ is furnished with glands secreting a glutinous mucus which causes the prey to adhere to its horny tip. The Wryneck rarely makes a nest, or at best but a very poor one, usually depositing its eggs in some hole in a tree. The name Wryneck is derived from the bird's habit of writhing its head and neck in various directions with a serpentine motion. It has a number of other popular names [CUCKOO'S MATE, TURKEY-BIRD], and is probably the Hobby-bird of Browne (*Birds of Norfolk*). His description, "marvellously subject to the vertigo," refers, in Seebohm's opinion, to the wryneck's habit of feigning death when taken; while Wilkin thinks it is founded on the "singular motion of its head and neck." The actual habitat of the bird is Central Europe and Asia.

"That curious bird the *wryneck*, so dear to the classical scholar from its associations with witchcraft in Theocritus and Virgil, is the first to arrive; and certainly the weird manner in which its head seems to turn every way, as if on a pivot, while mouselike it crawls up and round an old well, goes far to account for its reputation as an uncanny bird."—*St. James's Gazette*, March 9, 1887.

1. *Lit.:* The quality or state of being wry or distorted; crookedness.

A. *As substantive.*

Eccles. & Church Hist.: The followers of John Wycliffe, Wiclif, or de Wiclif, &c. (there are about twenty ways of spelling the name). He was born at Hipswell, near Richmond, about A.D. 1324, and was educated at Oxford University. He is believed to have been in conflict with the Mendicant Orders about 1360, but none of his extant writings on the subject seem to have been penned at so early a date. In or about that year he obtained the wardenship of Balliol Hall, exchanged about 1365 for that of Canterbury Hall, which he soon lost, on account of alleged mental incapacity in the archbishop from whom he received the appointment. This deprivation was confirmed on appeal both by the Pope and the king. In July, 1374, he was nominated member of a legation to Pope Gregory XI. about Papal provisions, or reservation of churches. On February 3, 1377, he was summoned to appear before a Convocation of the Clergy on a charge of heresy, which ended abortively. On May 22, 1377, five Papal bulls were issued against him, and next year a second ecclesiastical trial took place, the Londoners, who are said to have been opposed to him on the former occasion, taking his part on this. In May, 1382, a synod of divines condemned his opinions, which led to his being prevented from any longer teaching in the University. In 1381 he issued sixteen theses against transubstantiation. Apparently about 1380 or 1381 he published the translation into English of the Bible and Apocrypha from the Latin Vulgate; a second edition or retranslation, less literal but smoother in style, was issued by John Purvey about A.D. 1388. This was after the death of Wycliffe, which took place in the parish of Lutterworth, in Leicestershire, of which he was rector, on December 31, 1384. On May 2, 1415, the Council of Constance condemned Wycliffe's tenets, and ordered that his books should be destroyed and his body dug up and burnt. [For his tenets see LOLLARDISM, for his followers LOLLARDS. See also HUSSITES.]

WYVERN.

Her.: An imaginary animal; a kind of dragon with wings, but having only two legs, the termination of its body being somewhat serpentine in form.

X.

X, the twenty-fourth letter of the English alphabet, is a superfluous letter, as it represents no sound which cannot be expressed by other letters. Thus, when used at the beginning of a word it has precisely the sound of *z*; when occurring in the middle of a word it usually has the sound of *ks*, as in *axis, taxes, foxes*, &c.; it also has the same sound in some cases when terminating a word, as *lax, wax*, &c.; when it terminates a syllable, and more especially an initial syllable, if the syllable following it is open or accented, it frequently has the sound of *gz*, as in *luxury, exhaust, exalt, exotic*, &c. As an initial it occurs only in words of Greek origin, or formed from Greek words, most of these formations being of a scientific or technical nature.

¶ 1. *X as a symbol is used:*

(1) In *numer.:* For ten, in this case being composed of two Vs (= 5) placed one above the other, the lower one being inverted. When placed horizontally (⋈) it stands for a thousand, and with a dash over it ($\bar{X}$) it represents ten thousand.

(2) In ordinary writing X is frequently used as an abbreviation for Christ. In this case the symbol is not the same letter as the English X, but represents the Greek X (= *Ch*), as in *Xn* = Christian, *Xmas* = Christmas.

2. X as used on beer-casks is said to have originally been employed to indicate beer which had paid ten shillings duty.

Biol.: A term introduced by M. Milne Edwards to designate that form of biogenesis in which the living parent was supposed to give rise to offspring which passed through a totally different series of states from those exhibited by the parent and did not return into the cycle of the parent. Prof. Huxley remarks that the proper term for this would be heterogenesis, but that unfortunately this term has been employed in a different sense; and after showing that there are analogies both for and against xenogenesis, decides against its known existence. The nearest approach to it is not, as was once believed, in tapeworms, the history of whose transformations has been traced, but in tumours and corns on the animal body or galls on the vegetable leaves or other organs. 1. A mode of printing or graining from the natural surface of the wood. A piece of wood is selected of fine quality, having the pattern of grain desired. The surface is treated chemically to open the pores. After it is dry the surface is painted and a sized sheet of paper laid over the board, and both run together between rollers in the manner of copperplate printing. The paint is then transferred to the board, the differences in the absorbent qualities of the board determining the depth of colour. The paper is laid face downward on the article to be ornamented, and rubbed on the back with a soft pad to transfer the impression.

2. A name given to a process of decorative painting on wood. A selected pattern or design is drawn on wood, which is then engraved, or the design is reproduced in zinc by the ordinary method. An electrotype cast is taken from the woodcut or zinc plate, and smooth surfaces of wood are printed from the stereotype under regulated pressure with pigments prepared for the purpose. The colour penetrates the wood, leaving no outside film, and after being French-polished, or covered with a fluid enamel, the wood may be rubbed, scrubbed, or even sand-papered without destroying the pattern. Y.

Y, the twenty-fifth letter of the English alphabet is, in modern English, both a consonant and a vowel. It is taken from the Latin, into which language it was adopted from the Greek Y (υ) or upsilon. It sometimes represents the Anglo-Saxon ȝ, which is supposed to have had a sound resembling that of the French *u* or German *ü*.

I. At the beginning of syllables, and when followed by a vowel, *y* is a palatal consonant, being formed by bringing the middle of the tongue in contact with the palate, nearly in the position to which the *g* hard brings it. Hence, the A.S. hard *g* has often been softened to *y*, as in *day* = A.S. *dag*, *may* = A.S. *mag*, &c. In words of Romance origin *y* frequently represents:

1. French *-ie* = Lat. *-ia*, as in *barony*, *company*, *copy*, *jolly*, *family*, *memory*, *victory*, &c.

2. Lat. *-ium*, as *augury*, *horology*, *remedy*, *study*, &c.

3. Lat. *-atus*, as *attorney*, *deputy*, *ally*, *quarry*.

4. Fr. *-if*; Lat. *-ivus*, as *hasty* (= O. Fr. *hastif*), *jolly* (= Mid. Eng. *jolif*; O. Fr. *joli*, fem. *jolive*), *testy*, &c.

5. Many words ending in *y* have come through Lat. nouns in *-ia* (= Fr. *-ie*), from Gr. *-εια*, as *analogy*, *apology*, *blasphemy*, *philosophy*, &c.

6. As an adjectival termination, *y* generally represents the A.S. *-ig*, as in *stony* = A.S. *stánig*, *hungry* = A.S. *hungrig*. So also in some nouns it represents A.S. *-ig*, as in *honey* = A.S. *hunig*. In the suffix, *-ly* it is both an adjectival and an adverbial suffix, and represents the A.S. *-ic*, *-ice*, or *-iche*, as *godly* = A.S. *godlíc*, *friendly* = A.S. *freóndlíc*, *hardly* = A.S. *heardlice*. In nouns ending in *-ty*, this ending represents the Fr. *-té*, Lat. *-tatem* (nominative *-tas*), as in *vanity* (= Fr. *vanité*, Lat. *vanitatem*, accus. of *vanitas*), *calamity*, &c.

II. In the middle, and at the end of words, *y* is a vowel, and is precisely the same as *i*. When accented it is pronounced as *i* long, as in *dĕ-fȳ'*, *dȳ'-ing*, &c., and when unaccented as *i* short, as in *glōr'-ȳ*, *jōl'-lȳ*, *çīt'-y*, &c.

¶ *Y* was sometimes called the Pythagorean letter, from its Greek original in its form of three limbs representing the sacred triad formed by the duad proceeding from the monad.

¶ (1) *As a symbol:* In chem., Y is the symbol of Yttrium (q.v.).

(2) *As a numeral:* Y stands for 150, and with a dash over it (Ȳ) for 150,000.

yak, *s.* [Native name.]

Zool.: *Poephagus* († *Bos*) *grunniens*, a species of ox from the mountainous regions of Tibet. There are two races: the wild yak, generally black, which is found near the snow line, descending into the valleys in winter, and a domesticated race of various colours, black and white being most common. The yak is about the size of the common ox, to which it has a general resemblance, but it is covered with a thick coat of long, silky hair, hanging down like the fleece of a sheep, completely investing the tail, and forming a lengthy fringe along the shoulders, flanks, and thighs. Mr. Bartlett considers that this fringe, which exists in both races, was developed as a protection to the animal in its alpine haunts, as the long hair forms a sort of mat which defends the body from the effects of cold when the animal is reposing in the snow. The domesticated race is of great importance to the natives of Tibet. The yak is employed as a beast of burden, but never for tillage or draught; the milk is very rich, and yields excellent butter; the flesh is of the finest

quality, and that of the calves far superior to ordinary veal. The hair is spun into ropes, and made into coverings for tents, and the soft fur of the hump and withers is woven into a fine strong cloth. The tails, often dyed red, are made into the chowries, or fly-flappers, used in India. Yaks are often seen in zoological gardens and menageries, and have repeatedly bred in Europe, and it is probable that they might be advantageously introduced into the Highlands of Scotland and the northern parts of the Continent of Europe.

Yăñ'-keĕ, *s.* & *a.* [A word of doubtful origin. According to Mr. Heckewelder (*Indian Nations*, p. 112, quoted by *Bartlett: Dict. of Americanisms*, s.v.), the word was the first effort of the Indians "to imitate the sound of the national name of the English, which they pronounced *Yengees.*" According to Dr. W. Gordon (*Hist. Amer. War*, 1789, i. 324–5, quoted by Skeat), it was a favourite cant word in Cambridge, Mass., as early as 1713, and meant "excellent," as a *yankee* good horse, *yankee* good rider, &c. He supposes that it was adopted by the students there as a by-word, and, being carried by them from the college, obtained currency in the New England colonies, until at length it was taken up in other parts of the country, and applied to New Englanders generally as a term of slight reproach. Skeat, with reference to this account of the origin of the word, compares Lowland Scotch *yankie* = a sharp, clever, forward woman; *yanker* = an agile girl, an incessant talker, also = a smart stroke, a great falsehood, the fundamental idea being that of quick motion. [YACHT, *s.*, YANK (1), *s.*] Webster refers to another etymology: that it is "a corruption of *Jankin*, a dimin. of *John*, a nickname given to the English colonists of Connecticut by the Dutch settlers of New York;" but this is rejected by Skeat as looking "very like a pure invention."]

A. *As substantive:*

1. The popular name for the citizens of New England, but frequently applied by foreigners to all the inhabitants of the United States. During the American Revolution it was applied to all the insurgents, and during the Civil War it was the term commonly applied by the Confederate soldiers to the Federals.

B. *As adj.:* Of or pertaining to the Yankees, or Americans.

Yankee-doodle, *s.*

1. The name given to a famous air, now regarded as the national air of the United States. Very many accounts have been given of its origin: some have professed to trace it to the time of the Great Rebellion, and have asserted that "Nankee Doodle" was a nickname for Cromwell, and that the rhyme

"Nankee Doodle came to town, on a little pony,
He stuck a feather in his cap, and called him macaroni."

referred to his entry into Oxford. The term "macaroni" sufficiently confutes the theory, for the Macaroni Club did not come into existence till the middle of the eighteenth century. In all probability the tune is of English origin, and not more than a hundred and fifty years old. The first mention of it in print is said to occur in the Boston *Journal of the Times* for September, 1768:

"Those passing in boats observed great rejoicings, and that the *Yankee Doodle* song was the capital piece in the band of music."

The words, probably composed by Dr. Schuckburg who served under General Amherst, in the French and Indian war of 1755, are now never heard. According to Mr. Barclay Squire, "as a melody it has little beyond simplicity in its favour, but there is a quaint direct and incisive character about it which redeems it from vulgarity, besides which the historical associations of the tune, connected as it is with the establishment of American Independence, should have saved it from some of the criticisms to which it has been subjected." (*Grove: Dict. Music.*)

2. A Yankee.

The balk is then shifted to the stock-gang, which rips it into lumber.

But in later times *ye* was used as an objective as well as a nominative. *Ye* is now almost obsolete except in sacred or solemn writings or addresses, its place being taken by *you*. [YOU, YOUR.] The confusion between *ye* and *you* did not exist in Old English. *Ye* was always used as a nominative, and *you* as a dative or accusative. In the English Bible the distinction is very carefully observed; but in the dramatists of the Elizabethan period there is a very loose use of the two forms. Not only is *you* used as nominative, but *ye* is used as an accusative. (*Morris: Hist. Outlines of English Accidence*, § 155.)

The distinction between *yea* and *yes* was becoming neglected as early as the time of Henry VIII. *Yea* is now use only in writings or speeches of a solemn or sacred style.

1. A unit of time, marked by the revolution of the earth in its orbit. The year is either astronomical or civil. The former is determined by astronomical observation, and is of different lengths, according to the point of the heavens to which the revolution is referred. When the earth's motion is referred to a fixed point in the heavens, as a fixed star, the time of revolution is the time which elapses from the moment when the star, the sun, and the earth are in a straight line, till they again occupy the same position: this is called a sidereal year. If the revolution is referred to one of the equinoctial points, the year is somewhat shorter than the sidereal year, on account of the precession of the equinoxes, that is, the retrogression of the equinoctial points along the ecliptic. This is called the equinoctial, tropical, or solar year. The length of the sidereal year is 365·256..612 mean solar days, or 365 days, 6 hours, 9 minutes, 9·6 seconds. The length of the solar or equinoctial year is 365·2422414 mean solar days, or 365 days, 5 hours, 48 minutes, 49·7 secouds. The difference between these two years is 19 minutes 19·2 seconds mean solar time, that being the time required for the earth to advance in its orbit a distance of 50·1″ of arc. The civil year is the year of the calendar. It contains a whole number of days, beginning always at midnight of some day. According to the present system, or according to the Gregorian calendar, every year the number of which is not divisible by 4, also every year which is divisible by 100, and not by 400, is a common year, and contains 365 days. All other years are called leap years, and contain 366. The ecclesiastical year is from Advent to Advent. A lunar year is a period consisting of twelve lunar months. The astronomical lunar year consists of twelve lunar synodical months, or 354 days, 8 hours, 48 minutes, 36 seconds. The common lunar year consists of twelve lunar months or 354 days. The legal year in England, up till 1752, was from March 25 to March 25; now it is from Jan. 1 to Jan. 1. The Embolismic, or Intercalary lunar year, consists of 13 lunar civil months, and contains 384 days.

2. The period in which any planet completes a revolution: as, the *year* of Jupiter or of Saturn.

II. *Technically:*

1. *Chem.:* Barm. The yellowish, viscid substance deposited from beer, or which rises to the surface of saccharine solutions during the process of fermentation. Under the microscope, it appears as a mass of round or egg-shaped cells, termed Torulæ, containing granular matter. These exist either single or associated in heaps or strings, each cell having an average diameter of $\frac{1}{3000}$ of an inch, and consisting of a thin-walled sac or bag containing protoplasm. Yeast is the potent agent in the production of alcohol from sugar, each molecule of sugar splitting up into alcohol and carbonic anhydride, by a process which is not clearly understood. Heated to a temperature of 40°, its efficiency is almost entirely destroyed; but, when deprived of its water by straining and strong pressure, and kept in a cool place, it retains its properties unaltered for ten or twelve days. When washed with alcohol, dried at a low temperature, and mixed with a little starch, it retains the power of setting up the alcoholic fermentation for several months. Grape-juice, and several other vegetable juices, when left for a few days at a suitable temperature, develop yeast cells in great abundance, without any addition of yeast, probably from the presence of spores in the surrounding atmosphere. In bread-making, yeast, both in its liquid and dried states, is added with warm water to flour to give a start to the fermentation process, thereby supplying carbonic-acid gas, which communicates a spongy or light texture to the bread. It is also essential to the production of wine from grape juice and other fruit juices, the manufacture of beer, and the preparation of distilled spirits.

2. *Pharm.:* Beer yeast, when applied externally, acts as a stimulant and antiseptic. As a poultice it corrects the discharges of indolent ulcers. It has been given also internally in low states of the system, but with doubtful efficacy. (*Garrod.*)

B. *As substantive:*

1. *Art, &c.:* One of the three primary colours; a bright golden colour, the type of which may be found in the field buttercup, which is a pure yellow. Mixed with blue, yellow yields green, and with red it produces orange. All our yellow pigments are alloyed with blue or red. Gamboge is a tolerably pure yellow pigment, but is tinged with blue; then comes gold ochre tinged with red; next, yellow ochre and Naples yellow. The other yellow pigments are chrome yellow, lemon yellow, Indian yellow, gall-stone, Roman ochre, Mars yellow, terra di Sienna (raw and burnt), Indian pink, cadmium yellow, &c. The principal yellow dyes are obtained from arnotto, fustic, French berries, quercitron bark, turmeric, saw-wort, weld and willow leaves; also from chromate of lead, iron oxide, nitric acid, sulphide of antimony, and sulphide of arsenic. In blazonry, gold is the symbol of love, constancy, and wisdom; and, by opposition, yellow in our days still denotes inconstancy, jealousy, and adultery. In France the doors of traitors were daubed with yellow; and in some countries the law formerly ordained that Jews should be clothed in yellow because they had betrayed our Lord. Judas is represented clothed in yellow. In China, yellow is the symbol of faith.

2. *Dendroica æstiva*, common throughout the United States. Length about five inches; head and lower parts bright yellow, rest of upper parts olive-yellow; back, breast, and sides streaked with brownish-red; two yellow bands on wings. Called also the Yellow-Poll Warbler and Summer Yellow Bird. The Cow-bird often deposits one of its parasitic eggs in the nest of the Summer Yellow Bird, which being unable to eject the large strange egg, pecks a hole in it and buries it at the bottom of the nest. If by chance the Cow-bird visits the same nest a second time, the egg is again buried, and thus are formed the three-storied nests occasionally found by egg-hunters. (*Ripley & Dana.*)

yellow-fever, *s.*
Pathol.: A malignant fever, varying considerably in character in different cases, but nearly always marked by the yellowness of the skin, which gives it its name, and, at an advanced stage, by the vomiting of dark coloured matter, whence it is often termed black vomit. It is a disease of hot countries, not rising high up mountain slopes, but breaking out in low and moist places, generally on the coast or when the temperature for a few weeks previous has been 72° Fahr., or more. The southern parts of North, and the tropical parts of South America, the West Indies, the Bermudas, the south of Spain, Portugal, the hotter parts of Africa, &c., are the places or regions which it has chiefly ravaged. Negroes, and even mulattoes, are however, almost wholly exempt from its attacks. In tropical seas or harbours, it has often broken out on shipboard, evil-smelling bilge-water having been the most potent factor in its production. Formerly it was believed to be contagious, now the contrary opinion is established on irresistible evidence. It is not communicated by contact with individuals, but people may take it by entry into the infected areas. It is a bilious fever, normally of the remittent type, though the remissions are often so slight and brief as to make it look like a continued fever, while sometimes, as it is departing, it passes into an intermittent. Its approach is generally foreshadowed by lassitude, loss of appetite, slight headache, and mental depression; the attack then commences, and, as in the case of cholera, generally in the night. The first, or cold stage, is marked by a feeling of chilliness, the patient, in certain very bad cases, succumbing at once. Generally, however, reaction takes place into the hot stage, the pulse rising, and the heat of the body increasing to 105° or 107°. There is acute headache, especially over one orbit; the conjunctiva is injected, the eyes become abnormally brilliant, the tongue pasty, with the edges and the apex red, the bowels intensely painful [RACHIALGIA], great irritability of the stomach arises, with constipation, diminution in the quantity of urine, and pain in the calves of the legs and in the knees. The patient cannot rest, but tosses his arms and his head about. The fever continues from three to seven or even nine days, a remission taking place at the end of the second or third day. Convalescence follows in favourable cases; in others the pulse becomes irregular, feeble, and slow, there are stupor of the brain, difficult breathing, and a vomiting of dark grumous blood, blood also coming from the gums, the nostrils, and other parts of the body. Then follow coma, convulsions, and death. The average mortality is about one in three of those attacked. Little can be done for a patient in yellow fever except to remove him from the infected area and give him very light, nourishing food and good nursing. When the disease becomes epidemic in a region, sanitation is the proper method of arresting its progress. Relapsing fever (q.v.) is sometimes called Mild Yellow-fever.

Hist.: This disease appears to be of American origin, there being no evidence to show that it was known in Europe before the voyage of Columbus, while there are historical indications of its presence in San Domingo in 1493, in Porto Rico in 1508, and in other localities at various succeeding periods. It was first recognized in the West India Islands shortly after the coming of the whites, and it has ever since radiated from this region in the lines of commercial intercourse, extending to all the Atlantic coast cities of the United States, and to parts of Europe, its greatest ravages there having been in Spain. Its first appearance in the United States region was in 1693, when it visited Charleston, while Philadelphia was visited in the same year. In the succeeding period there were numerous appearances of yellow fever in the cities of this country, the severest outbreaks in the Atlantic coast cities being at New York in 1791, and at Philadelphia in 1762 and 1793, in which latter year the citizens died in such numbers that it was impossible to give them proper attention, and almost to bury them. A yellow fever hospital was established on Bush Hill, in which Stephen Girard, the celebrated philanthropist, cared for the sick with an attention and assiduity in which few of the citizens emulated him. Dr. Rush was equally assiduous in his attendance upon the sick, and employed blood-letting in his treatment with much success. This is no longer employed, but vigorous measures at the outbreak of the malady are still advocated. There have been epidemics in some of the northern cities within the present century, but none north of Norfolk since 1822, in which year strict quarantine was established in New York, Philadelphia, and Baltimore, and also in Spain, with the result of putting an end to epidemics in Europe, with the exception of Gibraltar in 1828. The more careful sanitation of recent years has also had to do with its disappearance. Yellow fever is never absent from some of the tropical cities. It has been persistent at Havana since 1761, at Rio de Janeiro since 1849, &c., the sufferers being largely among the strangers who visit these cities in the summer season. Where strict measures of sanitation are exercised, however, it is not likely to become again a scourge.

yellow-hammer, †yellow-ammer, yellow-bunting, *s.*
1. *Ordinary Language:*
Ornith.: *Emberiza citrinella*, one of the commonest British birds, widely distributed over Europe. Length about seven inches; general colour bright, with patches of dark brown, richly-mottled brownish-yellow on back, with a warm ruddy tinge; primaries black edged with yellow; chin, throat, and under part of body bright pure yellow turning to dusky-brown on the flanks; tail slightly forked, and shorter than in the Common Bunting. The female is similarly marked, but less bright in hue. The Yellow-hammer frequents hedges and low trees; it nests on the ground, and the male assists in incubation. The song consists of few notes, but is sweet and pleasing.

"In former Editions of this work the author strove to restore what he believed to have been the first English name of this bird—*Yellow Ammer.* As might be expected in such a case, custom, whether right or wrong, would not give way to the proposed amendment, and *Yellow Hammer*, with its abbreviation *Yellow Ham*, has been commonly printed from the days of Turner (1544) and Merrett (1667) to the present. There can indeed be no question of 'Hammer' (in this sense) being strictly cognate with the German *Ammer*, but it would seem that prefixing the letter H to the word is not wholly an English peculiarity, since there is some ground for believing that *Hammer*, which now survives in *Hämmerling* [Yellow-hammer], was equally with Ammer a Teutonic form."—*Yarrell: British Birds* (ed. 4th), ii. 43. I. *Ordinary Language:*

1. In the same sense as II.

*2. A bow.

"Tubal with his *yew*

Sylvester: Handie Crafts, 490.

II. *Bot.:* The genus Taxus, spec. *Taxus baccata,* under which Sir J. Hooker places its six supposed species. An evergreen with spreading branches, linear acute leaves more

or less falcate coriaceous shining above, paler below, arranged in two ranks. Male catkins yellow, about a quarter of an inch long; females minute; fruit a red mucilaginous drupe or berry with green seed. It is indigenous in most parts of Continental Europe and in the Himalayas 6,000 to 10,000 feet above the sea-level, being in the last-named regions a much loftier tree than in England. The sap-wood of the yew is white, the heart-wood red, hard, close-grained, and susceptible of a fine polish. It weighs fifty-nine pounds to the cubic foot. It is prized in Europe by cabinet makers, and was formerly

1. Male flower; 2. Female flower; 3. Stamen; 4. Vertical section of fruit.

much used in England, as it still is in the Himalayas, for bow-making, being very tough. In some parts of the Khasia hills in Nepaul the yew is deemed sacred, and its wood is burnt as incense. In Tibet a viscous exudation from it, mixed with other gums, is similarly employed. A red dye is made from the tree in the Bhutia country. Bentley and Trimen state that the leaves and young branches in all circumstances act as a narcotico-acrid poison on human beings, horses, and cows; that the seed of the fruit is poisonous, but that the pulp surrounding it is not so. The bark is used in Kunawar as a substitute for tea, or is mixed with tea-leaves. The yew is not used medicinally in England. In India its leaves and fruit, which somewhat resemble digitalis in their effects, have been employed as a lithic in calculus, and as an antispasmodic in epilepsy and convulsions. There is an advantage in yew over digitalis—that the former does not accumulate in the system like the latter. The yew of the United States and Canada (*T. canadensis*) is a much humbler tree than the species above described, which is occasionally of great size, an example being formerly shown of 56 feet in circumference. The Japan Yew is of another genus, Pedocarpus. *P. nucifer* is a lofty tree of northern Japan and Nepaul, whose seed yields a culinary oil. There are other species of Pedocarpus in Asia, Australia, Chili, &c.

It believes in a primordial soul which has had existence from an earlier period than primeval matter, and holds that from the two arose the spirit of life (Mahanatma). Theoretically at least, its devotees can acquire even in this world entire command over elementary matter by certain ascetic practices, such as long continued suppression of the respiration, inhaling and exhaling the breath in a particular manner, sitting in eighty-four attitudes, fixing the eyes on the tip of the nose, and endeavouring, by the force of mental abstraction, to unite themselves with the vital spirit which pervades all nature and is identical with Siva. When this mystic union is effected, the Yogi can make himself lighter than the lightest, or heavier than the heaviest substance, or as small or as large as he pleases; he can traverse all space, can become invisible, can equally know the past, the present, and the future, and can animate any dead body by transferring to it his own spirit; finally he becomes united with Siva, and is exempt from the necessity of undergoing further transmigrations. ўt'-trĭ-ŭm, *s.* [Latinised from Ytterby, a town in Sweden.

Chem.: A dyad earth-metal, symbol **Y**, atomic weight 61·7, existing, together with erbium, as a silicate in gadolinite. It is obtained in the metallic state by digesting the mineral with hydrochloric acid, precipitating with oxalic acid, dissolving the oxalates formed in nitric acid, and separating by a series of fractional crystallizations; the erbium salt, being the less soluble of the two, crystallizing out first. On converting the nitrate into a chloride, and igniting with potassium, the metal is obtained as a blackish-gray powder, consisting of small, metallic, lustrous scales. It unites directly, at high temperatures, with chlorine, oxygen, and sulphur, and probably with other metalloids. The mineral Gadolinite is largely silicate of Yttria, and contains about 40 per cent. of the oxide of Yttrium. It has been found in large quantities in Texas, and more sparingly in Sweden and Norway. The oxide, Y_2O_3, is a yellowish-white powder.

yû′-ga, yoô′-ga, *s.* [Sansc. *yûga*, from *yuj* = to join.]

Hindoo Chron.: One of the periods into which the past history of the globe may be divided. There are four yugas: the Satya Yuga, containing 1,728,000 years; the Treta Yuga, 1,296,000; the Dwapara Yuga, 864,000 years; and the Kali Yuga, now in progress, began about B.C. 3094, and which will extend to 432,000 years. Horace Hayman Wilson points out that these numbers originate in the descending arithmetical progressions of 4, 3, 2, 1, according to the notions of diminishing virtue in the several ages applied to a cycle of 12,000 divine years, each equal to 360 years of mortals; and 12,000 × 360 is = 4,320,000, the periods of the four yugas added together. Z.

Z, the last letter of the English alphabet, is a sibilant consonant, and is merely a vocal or sonant *s*, having exactly the same sound as *s* in *please, ease, wise*, &c. The words in modern English which begin with *z* are all derived from other languages, principally from Greek. It was not known in the oldest English. When not initial, it frequently represents an older *s*, as *dizzy* = A.S. *dysig, freeze* = A.S. *freosan*, &c. It also stands for a French *c* or *s*, as in *hazard, lizard, buzzard, seize. Z* has intruded into *citizen* = Fr. *citoyen;* and it has changed into *g* in *ginger* = Lat. *zingiberi.* As a final it occurs in some onomatopoetic words, as in *buzz, whizz*, &c. In some southern dialects, as Kentish and Somerset, it is commonly used for *s.* In German it is very common, being a double consonant with the sound of *ts;* and similarly in Greek it was also a double consonant, representing the sounds *ds* or *sd.* In Britain it is called *zed;* in America, *zed*, or *zee.*

Zoology:

1. A popular name for any of the striped forms of the genus Equus; thus embracing the Quagga (q.v.), the True Zebra, and Burchell's Zebra. [2.] In all three the external characters are those of the Ass rather than of the Horse; the legs are without warts, the tail is furnished with long hairs only towards the extremity, the neck is full and arched, and the mane stiff and erect. All the species of this division are rapidly vanishing before advancing civilization, and in all probability will become extinct before very many years.

"This family [Equidæ] comprises the Horses, Asses, and *Zebras*."—*Nicholson: Zoology* (ed. 1878), p. 668.

2. *Equus zebra*, from the mountainous regions of South Africa. It stands about four feet and a half at the shoulder; ground tint white, with black stripes, vertical on body and horizontal on legs; limbs slender, head light, ears long and open. The zebra lives in small herds in secluded spots; its sense of hearing, sight, and smell is extremely acute, and on the least alarm the whole herd scampers off. When compelled to defend themselves zebras form a compact body with their heads in the centre and their heels outwards, and have been known to beat off the leopard with their kicks. The zebra has been domesticated, but its vicious temper renders it of little value as a beast of burden. Burchell's Zebra (*Equus burchellii*) differs little from the True Zebra, except in the fact that the ground tint is yellow.

"He who attributes the white and dark vertical stripes on the flanks of various antelopes to this process [sexual selection], will probably extend the same view to the Royal Tiger and the beautiful *zebra*."—*Darwin: Descent of Man*, ch. xviii.

zebra-wood, *s.*

Botany & Commerce:

1. A kind of wood, imported from South America, and used by cabinet makers, produced by *Omphalobium Lamberti*, a large tree belonging to the natural order Connaraceæ, and growing in Guiana. Its colours consist of brown on a white ground, clouded with black, and each strongly contrasted, thus somewhat resembling the skin of a zebra. Called also Pigeon-wood.

2. The wood of *Eugenia fragrans*, variety *cuneata*. It is a shrub about eight feet high, growing in Jamaica.

3. The wood of *Guettarda speciosa*, a tree twenty-five feet high, with scarlet coloured flowers, growing in the East Indies.

"Many of them [the stripes] as they diverged from the spine became a little branched, exactly in the same manner as in some *zebrine* species."—*Darwin: Variation of Anim. & Plants*, i. 58.

zē'-bū, *s.* [Native name.]

Zool.: Any breed or individual of *Bos indicus* (which by some authorities is considered a variety of *Bos taurus*, the Common Ox). The Zebus attain their greatest development in India, but range eastwards to Japan and westward to the River Niger. They vary greatly in size, some being larger than European cattle, while others are no bigger than a month-old calf. The horns differ in form; the dewlap is more or less developed; one hump is always present over the withers, sometimes there are two; colour varying from light ashy-gray to pure white. At present they exist only in a domesticated condition, and must have been early reduced to subjection by man, since all the sculptures of cattle at Elephanta, which are of high antiquity, represent the humped form. In many parts of India zebus are used as beasts of draught and burden, and occasionally for riding. In disposition they are gentle and docile, and are venerated by the Hindoos, who consider it a sin to slaughter them, though they do not object to work them. White zebu bulls, which are held particularly sacred by the Hindoos, are branded with the image of Siva, relieved from all labour, and allowed to wander at will, levying contributions on the stalls in the bazaars without let or hindrance. Their flesh is inferior to that of the Common Ox, except the hump, which is esteemed a delicacy.

zebu-cattle, *s.*

Zool.: The humped cattle of the eastern hemisphere.

"In many domesticated quadrupeds, certain characters, apparently not derived through reversion from any wild parent-form, are confined to the males or are more developed in them than the females—for instance, the hump on the male *zebu-cattle* of India."—*Darwin: Descent of Man*, ch. xviii.

Zĕch-ą-rī'-ąh, Zăch-ą-rī'-ąs, *s.* [Heb. זְכַרְיָה (*Zekhariyah*) = Zechariah (whom Jehovah remembers); זָכַר (*Zakhar*) = to remember, and יָהּ (*Yah*) = Jehovah: Sept. Ζαχαρίας (*Zacharias*); Vulgate, *Zacharius.*]

1. *Script. Biog.:* The name of many ancient Hebrews, including two prophets [2], various priests, and Levites (1 Chron. ix. 21; xv. 24, xxvi. 14; Neh. xii. 35, 41), &c.

2. *Old Testament Canon:* The eleventh in order of the twelve minor prophetic books. The name prefixed to it is that of "Zechariah, the son of Berechiah, the son of Iddo the prophet" ("the prophet" means Zechariah, not Iddo), Zechariah i. 1. In Ezra v. 1, vi. 14, he is called the son of Iddo, but son is sometimes used vaguely for lineal male descendant, and may easily signify grandson (cf. Gen. xi. 24-32; xxviii. 5; xxix. 15). When Cyrus permitted the Jews to return from Babylon he also accorded them permission to rebuild the temple (Ezra i. 3; vi. 3-5), and the foundations of the edifice were at once laid (Ezra iii. 10-13). The jealousy of the neighbouring tribes led to the stoppage of the work (Ezra iv. 1-24). At length, however, in the second year of Darius Hystaspes, permission was obtained to resume it (Ezra iv. 24, vi. 1-12), and building was recommenced with the patronage and active aid of Zerubbabel, the civil governor of Judæa, Joshua the High Priest, &c. Enthusiasm for the work was excited among the previously apathetic people by the prophets Haggai and Zechariah (Ezra v. 1-2). The former seems to have been the senior in point of years, and commenced his addresses and predictions in the sixth month of the second year of Darius, while Zechariah did so in the eighth month. The book of Zechariah, in its present form, is naturally divided into three portions—chaps. i.-viii., chaps. ix.-xi., and chaps. xii. xiv. The first is universally admitted to be the work of Zechariah. The natural sections of it are (1) chap. i. 1-6, dated the second year of Darius's reign and the eighth month; (2) i. 7-vi. 15, dated the twenty-fourth day of the eleventh month of the same year; and vii. 1-viii. 23, dated the fourth day of the ninth month of Darius's fourth regnal year. In the first the prophet counsels a return to Jehovah; in the second, which has in it various symbolic visions, he encourages the build

ing of the temple, and, in answer to a query whether the fasts begun at Babylon should be continued, he directs that they should be transformed into joyous festivals. The style of chapters ix.–xi. differs from that of the first eight; and that of xii.–xiv. to a certain extent from both. In x. 6, the house of Judah requires to be strengthened, as if its government still continued; that of Joseph (the ten tribes) to be saved, as if it were gone; and in verse 11 is the prediction "the pride of Assyria shall be brought down," as if it stood when the words were penned; whereas by the time of Darius Hystaspes it had for ever passed away. Some, therefore, assign these chapters to an earlier Zechariah, a contemporary of Isaiah (B.C. about 736). But if the Hebrew Javan in ix. 13 is correctly translated Greece, this would suggest a date late enough to be consistent with the best-known Zechariah's authorship, if not more recent still. Chaps. xii.—xiv. have been referred to some prophetic contemporary of Jeremiah, B.C. 607 or 606. The date of chaps. i.–viii. is admitted to be B.C. 520-518. Matt. xxvii. 9–10, nominally quoting Jeremiah, seems to refer to Zech. xi. 12–13, and unless Zechariah, the son of Berechiah, of whose death we know nothing, was martyred precisely in the same way as Zechariah, the son of Jehoiada (2 Chron. xxiv. 20, 21), the reference in Matt. xxiii. 35 would seem to be to the latter. Of these difficulties various solutions have been given. Zech. xiii. 7 is quoted by Our Lord as Messianic (Matt. xxvi. 31, Mark xiv. 27). In Matt. xxi. 5, Zech. ix. 9 is regarded as predictive of the entry of Jesus into Jerusalem.

zĕm-ĭn-dar', *s.* [Pers. *zemindár* = a landholder, from *zemín* = land, and *dár* = holding, a holder.] In India, one of a class of officials created under the Mogul Government of India. They have been regarded, first as district governors, secondly as landed proprietors, and thirdly as farmers or collectors of the government revenue on land. Their functions appear to have been to a great extent arbitrary and variable, but founded on and arising out of the last-named office. On the transference of the authority of the Moguls to the East India Company, the zemindars were in general treated as the proprietors of land. The term is of Persian origin, and the office probably originated with the Muhammadan conquerors of India, who claimed the soil of the country, but, leaving the Indian village tenure intact, set these officers called zemindars over districts comprising each a certain number of villages, the headmen of which accounted to them for the revenues of the land, which they collected with a liberal profit to themselves. At present, in Bengal, the zemindars have all the rights of a British landed proprietor, subject to the payment of the land-tax, and also to a certain ill-defined tenant-right on the part of tenants who have long held possession of their farms.

"It was contemplated that these *zemindars* would take the place of the landed gentry of European countries, and become leaders in all kinds of agricultural reforms."—*Field,* Feb. 11, 1888.

Zĕnd, *s.* [ZEND-AVESTA.]

1. *Philol.:* An ancient Iranian language in which are composed the sacred writings of the Zoroastrians. It is coeval and cognate with the Vedic Sanskrit. It embraces two dialects, called Bactrian, or Eastern Iranian, and the Western Iranian. The two Zend dialects consist of an earlier and a later, analogous to the Vedic and classic Sanskrit, or to the Homeric and classic Greek. The earlier dialect is called the Gâtha, from the Gâthas or sacred songs, which form the only remains of it; the later is that in which the Zend-Avesta, or sacred Zoroastrian writings are found. The present alphabet is comparatively modern, and is probably derived from the Syrian. There are twelve simple vowels, fourteen diphthongs, and twenty-nine consonants, represented by different characters. The roots are mostly monosyllabic, some consisting of only a single vowel, others of a vowel and consonant, or a vowel between two consonants. There are three numbers, singular, dual, and plural, with eight inflections in the first and last, and five in the middle number.

2. *Compar. Relig.:* A contracted name for the Zend-Avesta (q.v.).

Zend-Avesta, *s.* [Prob. = translation or commentary of text with paraphrase, from *avesta* = text, and *zend* = translation or commentary.]

Compar. Relig.: The sacred books of the Zoroastrians, Magians, Guebers, or Parsees, ascribed to Zoroaster himself, and reverenced as a bible or rule of faith and practice. They consist of several divisions: the Yazna, a sort of sacrificial ritual, consisting of hymns and prayers, contains the five gâthas in the older dialect; the Visparad is a collection of sacrificial prayers in later Zend. The Yashts are later collections of prayers, consisting of particular invocations of angels, &c., mixed with legends; the Vendidad contains the religious, civil, and criminal code of the Zoroastrians. The immortality of the soul, a future state of rewards and punishments, and the resurrection of the body are taught in the Zend religion.

1. *Scrip. Biog.:* A prophet, son of Cushi, who again was the son of Gedaliah, the son of Amariah, the son of Hizkiah (the king?).

2. *Old Test. Canon:* The ninth in order of the twelve minor prophetic books. Zephaniah prophesied in the reign of Josiah, king of Judah. Josiah, who came to the throne in his eighth year (B.C. 641), tolerated idolatry till the twelfth year of his reign (641–630); next for six years more (630–624) he carried on a partially successful contest against it; then during the remainder of his life (624–610), he made the reformation more sweeping, re-establishing Mosaic institutions throughout the land. When the prophet wrote, the worship of Baal had not quite ceased, nor had other forms of idolatry (Zeph. i. 4–5). His predictions, therefore, seem to have been uttered during the second period, some time between 630 and 624. With this agrees the reference in ch. ii. 12–15 to the impending destruction of Nineveh, which took place in 625. Zephaniah was contemporary with Jeremiah. The first chapter of the book denounces coming judgment, described as the day of the Lord [DAY, C. 3.], on Jerusalem and the Jewish people. The second prophesies the destruction of Gaza, Askelon, and the Philistine cities generally, the Moabites, the Ammonites, and the Assyrian capital Nineveh. The third censures the corruption of Jerusalem, which had affected princes, judges, priests, and prophets, and concludes with promises of future restoration and felicity. The chief characteristics of this book are the unity and harmony of the composition, the grace, energy, and dignity of its style, and the rapid and effective alternations of threats and promises. Its prophetical import is chiefly shown in the accurate predictions of the desolation which has fallen upon each of the nations denounced for their crimes; Ethiopia, which is menaced with a terrible invasion, being alone exempted from the doom of perpetual ruin. The general tone of the last portion is Messianic, but without any specific reference to the Person of our Lord. No serious controversy has ever taken place as to the authenticity of Zephaniah.

1. The type-genus of Zeuglodontidæ (q.v.). The remains were formerly supposed to be reptilian, and were named Basilosaurus by Harlan. They were re-named by Owen (who demonstrated their Mammalian character), and the new name was chosen because the first section of a molar examined was taken from the base of the crown, where it was beginning to divide into the roots, and thus it looked like two single teeth yoked or linked together. (*Trans. Geol. Soc. Lond.*, ser. ii., vol. vi., p. 67.) The names Phocodon and Phocodontia are sometimes given to the genus and family respectively, from the seal-like character of the dentition. Several species from the Eocene of the United States; a portion of a skull from the Barton Clay (Eocene) of Hampshire, England.

TOOTH OF ZEUGLODON.

2. Any species or individual of the Zeuglodontia (q.v.).

"The earliest Cetaceans of whose organization we have anything like complete evidence are the *Zeuglodons* of the Eocene period, which approach in the structure of skull and teeth to a more generalized mammalian type than either of the existing sub-orders. The smallness of the cerebral cavity compared with the jaws and the rest of the skull they share with the primitive forms of many other types."—*Encyc. Brit.* (ed. 9th), xv. 393.

In the anterior part of both jaws the teeth are simple, conical, or slightly compressed, and sharp-pointed. Dental formula: I. 3—3, C. 1—1, P.M. and M. 5—5 = 86. Skull elongated and much depressed, brain-cavity very small, strong sagittal crest. The characters of the dorsal vertebræ and the articulation of the ribs appear to have resembled those of Platanista. Huxley considered these animals to have been intermediate between the true Cetaceans and the Seals. By some authorities the group is made to include Zeuglodon (= Phocodon), Squalodon, and Saurocetes. Prof. Flower substitutes for it a sub-order (Archæoceti), and makes the Squalodons a separate family. [SQUALODONTIDÆ.]

zeūg′-ma, *s.* [Gr., from ζεύγνυμι (*zeugnumi*) = to join.] [YOKE.]

Gram.: The connexion of one word with two words or with two clauses, to both of

which it does not equally apply: so that, for one of them, another word (to be gathered from the sense of the passage) must be mentally supplied. Zeugma is therefore a species of ellipsis; both abbreviate discourse. Where the word to be supplied is a form of another in the sentence, as "I love you, and you [love] me," the construction is elliptical; where the sense requires a different word: as, "The sun shall not burn thee by day, neither the moon [injure thee] by night" (Ps. cxxi. 6. Prayer Book), it is zeugma.

zĭnc, *s.* [Dan. and Sw. *zink;* Fr. *zinc;* cogn. with Ger. *zinn* = *tin.*]

1. *Astron.:* It has been ascertained by spectroscopy that there is zinc in the sun.

2. *Chem. & Comm.:* A divalent metallic element, symb. Zn.; at. wt., 65; found in considerable abundance in many parts of Britain, in Silesia, and in the neighbourhood of Aix la Chapelle. It is extracted from the native carbonate by first roasting the ore, mixing it with charcoal or coke, and subjecting the mixture to a full red heat in an earthen retort. The reduced metal volatilizes, and is condensed by suitable means. It is bluish-white, tarnishes slowly in the air, is crystalline and brittle, with a density varying from 6·8 to 7·2. Between 121° and 149° it has the property of becoming malleable, and after such treatment retains this character when cold. At 411° it melts, and at a bright red heat boils and volatilizes. Ordinary zinc dissolves readily in dilute acids, but pure zinc is less soluble unless it is in contact with platinum, copper, or some other less positive metal, with which it can form a galvanic circuit. Solutions of zinc give a white precipitate with hydric sulphide. In consequence of its lightness and cheapness, sheet zinc is employed for lining baths and cisterns, for gutters, spouts, and roofs; for the latter purpose it is usually corrugated. Zinc plates are much used as generators of electricity in voltaic batteries and in zincography (q.v.). Zinc is also an important factor in the manufacture of alloys, and in the preparation of galvanized iron (q.v.).

3. *Pharm.:* Oxide of zinc given in small doses is a tonic and astringent, acting beneficially on the nervous system in chorea, epilepsy, hysteria, neuralgia, &c.; in large doses it is emetic; externally it is a desiccant and astringent. Sulphate of zinc and acetate of zinc produce similar effects. So apparently does the carbonate, which, however, is not much employed medicinally. Chloride of zinc is used externally as an escharotic; valerianate of zinc is a nervine tonic and antispasmodic, also an anthelmintic. (*Garrod.*)

¶ Zinc occurs somewhat abundantly in the United States, where its production is rapidly increasing. In 1889, the yield was 58,860; in 1890, 63,683; in 1891, 80,334 short tons, chiefly smelted in Illinois, Kansas and Missouri. In Great Britain the annual yield of the zinc mines is about 23,000 tons, half of it coming from Wales.

zinc butter, *s.* [ZINC-CHLORIDE.]

zinc-chloride, *s.*

Chem.: $ZnCl_2$. Zinc-butter. Easily prepared by dissolving the metal in hydrochloric acid. It is a nearly white translucent substance, fusible, and very deliquescent; easily soluble in water and alcohol, and forming a double salt with sal-ammoniac; very useful in tinning and soft soldering copper and iron. It is also useful as an antiseptic, and, like sulphuric acid, withdraws the elements of water from organic bodies.

zinc-cyanide, *s.*

Chem.: $ZnC_2N_2 = Zn(CN)_2$. A white insoluble powder, obtained by adding hydrocyanic acid to zinc acetate. It is decomposed by acids with evolution of hydrocyanic acid, but is soluble in excess of potassic cyanide, the solution yielding on evaporation octahedral crystals of potassic zinc cyanide.

zinc-ethide, *s.* [ZINC-ETHYL.]

zinc-ethyl, *s.*

Chem.: $Zn(C_2H_5)_2$. Zinc-ethide. An organometallic compound discovered by Frankland, and formed by heating ethyl iodide with zinc in a sealed glass tube or copper cylinder. The zinc eth-iodide is first formed, which, when distilled in an atmosphere of hydrogen, is resolved into zinc iodide and zinc ethyl. It is a mobile, volatile, and disagreeable smelling liquid, boiling at 118°, and having a specific gravity of 1·182. It takes fire instantly on coming in contact with the air, and water decomposes it violently with formation of zinc hydroxide and ethane ($ZnH_2O_2 + C_2H_6$).

The zither consists of a resonance-box, with a large circular sound-hole near the middle; the strings, thirty-two in number, in some cases increased to forty and even forty-six, being made of steel, brass, catgut, and silk covered with fine silver or copper wire, and tuned by pegs at one end. Five of the strings are stretched over a fretted key-board, and are used to play the melody, the fingers of the left hand stopping the strings

on the frets, the right hand thumb, armed with a metal ring, striking the strings, which are tuned in fifths, and have a chromatic range from C in the second space of the bass staff to D on the sixth ledger line above the treble. The remainder, called the accompaniment strings, are struck by the first three fingers of the right hand, and, as they are not stopped, produce only the single note to which they are tuned. Whilst playing the performer rests the instrument on a table with the key-board side nearest to him. The viola zither, in which the resonance-box is heart-shaped, is tuned like the violin (q.v.), and is played with a bow. The form of the instrument is like that of the viola, but the body rests on the lap of the seated player, while the head is placed on the edge of a table.

The fruit of *Z. nummularia*, which grows in India, is considered to be cool and astringent, and it is given in bilious disorders. The bark of *Z. Jujuba* is said to be a remedy for diarrhœa; the root in decoction is given in fever, and, powdered, is applied to sores. In the Himalaya districts the bark is

used as a tan and a dye-stuff. The bark of *Z. xylopyra*, a large scrambling shrub found in the hilly parts of India, is also used for tanning and for dyeing black. The root of *Z. Napeca* is given as a remedy in windy colic. *Z. Jujuba*, *Z. nummularia*, *Z. rugosa*, and *Z. vulgaris*, yield a gum. A decoction of the leaves of *Z. glabrata* is said to purify the blood. The dried fruits of *Z. vulgaris* are considered suppurative, expectorant, and fitted to purify the blood. The bark is used as an application to wounds and sores. The kernels of *Z. soporiferus* are regarded by the Chinese as soporific. The bark of *Z. Jouzeiro* is bitter, astringent, somewhat acrid, and tends to produce sickness. *Z. * **1.** *Ord. Lang.:* A girdle, a belt, a zone.

"By his side,
As in a glistening *zodiac*, hung his sword."
Milton: P. L., xi. 247.

2. *Astron.:* The zone or broad belt of constellations which the sun traverses during the year in passing around the ecliptic. The moon and major planets also move within the same area. The breadth of the zodiac is about eight and a half degrees on each side of the ecliptic, or seventeen in all. It is inclined to the equinoctial at an angle of about 23° 28′, the points of intersection being reached by the sun, one at the vernal and the other at the autumnal equinox. The great circle of the zodiac was divided by the ancients into twelve equal portions called signs. They were named from the constellations then adjacent to them in the following order: Aries, the Ram; Taurus, the Bull; Gemini, the Twins; Cancer, the Crab; Leo, the Lion; Virgo, the Virgin; Libra, the Balance; Scorpio, the Scorpion; Sagittarius, the Archer; Capricornus, the Goat; Aquarius, the Waterbearer; and Pisces, the Fishes. The sun formerly entered Aries on March 20; now, owing to the precession of the equinoxes, the point of the heavens intersected by the celestial equator and the ecliptic, technically called the first point of Aries, has moved well into Pisces.

zodiacal-constellations, *s. pl.*

Astron.: The twelve constellation from which the signs of the zodiac are named.

zodiacal-light, *s.*

Astron.: A pearly glow spreading over a portion of the sky near the point at which the sun is just about to rise in the morning or has just set in the evening. It extends from the horizon a considerable distance towards the zenith, and is best seen in the tropics in spring evenings about the time of the vernal equinox. In the latitude of London it is seen chiefly in the western part of the sky in early spring after the evening twilight, and at the close of autumn before daybreak in the eastern horizon. The generally accepted theory of the zodiacal light is that it consists of a continuous disc, whether of meteors or any other substance, in which the sun is central.

zō′-ĕ-a, *s.* [Gr. ζώη (*zōē*) = life.]

Zool.: A pseudo-genus of Crustacea, founded on the larvæ of some of the higher forms. zō′-ĕ trōpe, *s.* [Gr. ζώη (*zōē*) = life, and τρόπη (*tropē*) = a turning.] A mechanical toy depending, like the thaumatrope, for its interest upon the constancy of visual impressions. It consists of a rotating drum, open at the top, in which, around its inner periphery, are placed strips of paper having figures of men, animals, &c. in varying positions. By turning the cylinder the images are seen through slots in its upper side, giving the effect of action to the figures. For instance, a clown jumping through a hoop is represented in perhaps a dozen different positions. The turning of the drum brings into view, in rapid succession, these varying positions until they blend into a perfect image full of motion, and operating to simulate natural action. A man sawing wood, an animal kicking, an acrobat playing with clubs, may be thus shown in apparent motion.

zō′-har, *s.* [Heb. זֹהַר (*tsochhar*) = whiteness, splendour.]

"How could he then find comfort in *Zolaistic* France?"—*Athenæum*, Jan. 30, 1886, p. 160.

Zōll′-vĕr-ēin (z as dz), *s.* [Ger. *zoll* = toll, duty, and *verein* = union or association.]

1. The German commercial or customs union, founded originally in 1827, but extended greatly after the war of 1866, when, owing to political considerations, Prussia obtained a preponderating influence in the union, which included the North German Bund, Bavaria, Wurtemburg, Baden, Hesse, and Luxemburg. This arrangement was brought prematurely to an end by the formation of the German Empire. By article 33 of the constitution of the Empire, the territory of the Zollverein coincides with the territories of the Empire, with the exceptions of the free ports of Hamburg, Altona, Bremen, Bremerhaven, Geestemunde, and Braake, and some communes of the Grand-duchy of Baden, while Luxemburg and the Austrian canton of Jungholz are included in it. Its object is the regulation of a uniform rate of customs duties throughout the various states comprised in the union. The free ports were included in the Zollverein in October, 1888.

2. Hence, any commercial or customs union.

B. *As adj.:* Pertaining to or resembling an animal.

zō-ŏl′-a-trў, *s.* [Pref. *zoo-*, and Gr. λατρεία (*latreia*) = worship.]

Compar. Relig.: Animal worship; adoration paid by man to any of the lower animals. This cultus seems to have passed through three stages: (1) The animal was reverenced and propitiated as possessing a power greater than that of man; (2) The animal was regarded as an incarnation of some deity or spirit; (3) It was raised to the position of a tribal ancestor. [Totem.] In the early history of the human race zoolatry of some kind was very prevalent. Traces of it appear in the Bible as in the story of the Golden Calf made by the Israelites (Exod. xxxii). Zoolatry took deep root in the religious life of the ancient Egyptians, and all three forms flourished among that people. Juvenal opens his fifteenth satire with a scathing invective of Egyptian zoolatry, and detailed accounts of it occur in Herodotus (ii.), Plutarch (*de Isiide et Osiride*), Strabo (lib. xvii.), and Cicero (*de Nat. Deor.*, iii. 15). In classic times the chief form of zoolatry was serpent-worship (q.v.), though traces of other forms occur in the transformation myths of the poets. In the present day zoolatry survives chiefly in India [Vishnu, Hunooman, Zebu], among the snake-worshippers of the west coast of Africa, and the Red Indians of North America.

"The three motives of animal-worship . . . viz., direct worship of the animal for itself, indirect worship of it as a fetish acted through by a deity, and veneration for it as a totem or representative of a tribe-ancestor, no doubt account in no small measure for the phenomena of *zoolatry* among the lower races, due allowance being also made for the effects of myth and symbolism, of which we may gain frequent glimpses."—*Tylor: Prim. Cult.* (ed. 1873), ii. 237.

zō′-ō-līte, *s.* [Pref. *zoo-*, and Gr. λίθος (*lithos*) = a stone.] A fossil animal substance.

"for the advancement of Zoology and Animal Physiology, and for the introduction of new and curious subjects of the Animal Kingdom." Numerous societies have since been organized, in the cities of the United States and Europe, for inquiry into the characteristics and life history of animals. Zoological study is the leading feature of many of our prominent scientific institutions, such as the Academy of Natural Sciences of Philadelphia, the American Museum of Natural History, of New York, and various others, and less exclusively of the Smithsonian Institution of Washington. All these Societies and Institutions publish *Proceedings* or journals under other titles containing details of their work and original communications in zoology.

zō-ŏl′-ō-ġў, *s.* [Pref. *zoo-*, and Gr. λόγος (*logos*) = a discourse].

Natural Science: The study of living animals, a branch of Biology, which also includes Botany, though it is impossible accurately to define the limits of these two branches, some organisms, low in the scale of life, being sometimes claimed as animals and sometimes as plants. Zoology covers a large ground, which becomes larger with the growth of the science. The chief branches of Zoology are: (1) Morphology, dealing with form and structure; (2) Comparative Anatomy, which investigates the position and relation of organs and parts (and, as this must be the foundation of scientific classification, the term Comparative Anatomy is often used as synonymous with the older term Zoology); (3) Embryology, dealing with development from the ovum to maturity; (4) Physiology (q.v.), which treats of the organs of nutrition, reproduction, and the nervous system; (5) Classification or Taxonomy, which classifies animals into natural groups; (6) Zoogeography (q.v.); and (7) Descent of the individual (Ontogenesis) and of the phylum (Phylogenesis). From the earliest times man was accustomed to study and observe the lower animals. Solomon's description of the ant (Prov. vi. 6–8) is justified by the scientific observation of the nineteenth century; Job (xxxix. 14) knew the peculiar method of incubation adopted by the ostrich; and Jeremiah (Lam. iv. 3) speaks in unmistakeable terms of marine mammals. Aristotle and Pliny have recorded many zoological facts, and nearly as many legends; but from that time down to the days of Ray and Willughby there was scarcely any attempt at scientific classification, nor was it till the eighteenth century that anything like a comprehensive scheme was put forth in the *Systema Naturæ* of Linnæus, who divided the Animal Kingdom into six classes: Mammalia, Aves, Pisces, Amphibia, Insecta, and Vermes, these classes being divided into orders, and these again into genera, without any intermediate division. In the light of the present day this scheme is seen to be erroneous, but it formed a rough outline, which served as a guide to future inquirers. Cuvier's classification came next, with four sub-kingdoms: Vertebrata, Mollusca, Articulata, and Radiata. Agassiz adopted these main divisions, but arranged his classes somewhat differently. The classification of Owen in his *Comparative Anatomy of Invertebrates* (ed. 2nd, p. 16) was:

Sub-kingdom.	Divisions.
Vertebrata.	Pisces, Aves, Reptilia, Mammalia.
Mollusca.	Tunicata, Brachiopoda, Lamellibranchiata, Pteropoda, Gasteropoda, Cephalopoda.
Articulata.	Cirripedia, Anellata, Epizoa, Crustacea, Insecta, Arachnida
Radiata. Sub-provinces. Infusoria.	Rotifera, Rhizopoda, Polygastrica.
Entozoa.	Cœlhelmintha, Turbellaria, Sterelmintha.
Radiaria.	Echinodermata, Bryozoa, Anthozoa, Acalephæ, Hydrozoa.

Huxley (*Introd. to Class. of Animals*, 1869) adopted the following:

Sub-kingdom.	Divisions.
Protozoa.	Rhizopoda, Gregarinida, Radiolaria, Spongida
Infusoria.	
Cœlenterata.	Hydrozoa, Actinozoa
Annuloida.	Echinoida, Entozoa.

Mollusca.	Lamellibranchiata, Branchiogastropoda, Pulmogastropoda, Pteropoda, Cephalopoda.
Vertebrata.	Pisces, Amphibia, Reptilia, Aves, Mammalia.

Last and chief in importance is the classification of Gegenbaur, of which Ray Lankester says (in his preface to *Gegenbaur's Elements of Comp. Anat.*, ed. Bell), that "at the present day, naturalists have learnt to recognise in their efforts after what was vaguely called the 'natural' system of classification, an unconscious attempt to construct the pedigree of the animal world. The attempt has now become a conscious one. Necessarily classifications which aim at exhibiting the pedigree vary from year to year with the increase in our knowledge. They also vary according to the importance attached by their authors to one or another class of facts as demonstrating blood-relationship."

2. *Anthrop.:* Representing a god or other supernatural being under the form of one of the lower animals. The zoomorphic element in Classic mythology appears in such cases as that of the Sminthean Apollo, and the metamorphoses of Jupiter; it is very strongly marked in the religion of ancient Egypt [Zoolatry], and traces of it may be found among the Jews and in the poetic imagery of the Apocalypse. (Gen. iii. 24; Exod. xxv. 18; Ezek. x. 14, xi. 18; Exod. xxxiii.; Rev. iv. 6, 8, 9; v. 6, 14; i. 6; vii. 11; xiv. 3; xv. 7; xix. 4).

zō′-ŏn, *s.* [Gr. ζῷον (*zōon*) = an animal.]

Biol.: The product of a fertilized ovum.

"It is urged that whether the development of the fertilized germ be continuous or discontinuous is a matter of secondary importance; that the totality of living tissue to which the fertilized germ gives rise in any one case is the equivalent of the totality to which it gives rise in any other case; and that we must recognise this equivalence, whether such totality of living tissue takes a concrete or a discrete arrangement. In pursuance of this view a zoological individual is constituted either by any such single animal as a mammal or bird, which may properly claim the title of a *zoon*, or by any such group of animals as the numerous Medusæ that have been developed from the same egg, which are to be severally distinguished as zooida."—*Herbert Spencer: Prin. A. *As adj.:* Of or pertaining to Zoroaster or Zoroastres, the classical name of an illustrious personage called in Persian Zartusht, Zaratusht, or Zardusht, and in Zend Zarathustra, founder or reformer of the Parsee religion. He is generally said to have been born in 589, at Urmia, a town of Azerbijan, and died B.C. 539. But other dates have been assigned, and there may have been more than one Zoroaster. [ZOROASTRIANISM.]

B. *As subst.:* A follower of Zoroaster, a professor of Zoroastrianism (q.v.).

zŏr-ō-ăs′-trĭ-ạn-ĭzm, *s.* [Eng. *zoroastrian; -ism.*]

Compar. Relig.: The religious system said to have been taught by Zoroaster, by which term Dr. Haug understands a series of religious teachers rather than a single person bearing the name. The old Persians and the Brahmans continued one people after they had separated from the primitive Aryan stock, their faith being Nature-worship. For the subsequent religious schism between them see BRAHMANISM. The first Zoroaster, if there was more than one, is believed by Dr. Haug to have lived as early as Moses, or, at least, not later than Solomon. He was the reformer rather than the originator of the faith called after his name. The Zoroastrian sacred book is the Zend Avesta (q.v.). The creed founded on it was professed by the old Persians, as it is by their successors the modern Parsees, sometimes called Fire-worshippers. It teaches that there has always existed a certain entity, whose name, Zarûâna Akarana, has been translated "Time without bounds." This entity is represented as having simultaneously brought into existence two exceedingly powerful beings: one, Hormuzd, the creator and patron of all good; the other, Ahriman, the author and supporter of all evil. Hormuzd created light, and Ahriman darkness. The two beings are in perpetual conflict; and each has under him a hierarchy of angels. This system is denounced in Isaiah xlv. 5–7. With it another creed—that of fire-worship—possibly derived through the Magi from the Turanians, became commingled: there is allusion to it in Ezekiel viii. 16–18. Both beliefs go to constitute the modern Parsee faith. Professor Haug believes that the teaching of the primitive Zoroaster was misunderstood, and that it was much purer than the system of doctrine which has long passed current in his name. [FIRE-WORSHIPPER, GUEBRE, PARSEE.]

This idea, however, was soon abandoned, and since 1840 the corps has been composed almost entirely of French soldiers, recruited from the veterans of ordinary line regiments, who are distinguished for their fine physique and tried courage. They still, however, retain the picturesque dress originally adopted, consisting of a loose dark-blue jacket and waistcoat, baggy Turkish trousers, yellow leather leggings, white gaiters, a sky-blue sash, and a red fez with yellow tassel. The few corps composed of Algerines still connected with the French army are now known as Turcos. The name was also given to several regiments which served on the side of the North in the American Civil War, but these were only distinguished from the other volunteer regiments by their picturesque uniform.

A. *adj.:* Of, pertaining to, or introduced by Zwingli. [B.]

B. *As substantive:*

Church Hist. (Pl.): The followers of Ulrich Zwingli, or Zuingli, the Swiss reformer, especially in his sacramentarian doctrine. Zwingli was born at Wildhaus, in the Toggenburg, in January, 1484, the year after Luther's birth, and was ordained priest in 1506. In 1516, a year before the commencement of the German Reformation under Luther, he began to preach doctrines which were essentially those of Protestantism. In 1518 he was in conflict with Samson, a Franciscan friar and an eager salesman of Indulgences. In January, 1525, mainly through his exertions, the mass was abolished at Zurich, other cantons speedily following the example. Differences of opinion regarding the Eucharist having arisen in 1524 between the German and Swiss Reformers, Zwingli took a prominent part in the controversy with Luther in a conference at Marburg in September, 1529. On October 15, 1531, he was killed in the battle of Cappel, fought on a politico-religious question between the Protestant and the Roman Catholic Swiss cantons.

Zwingli's views on the sacrament were afterwards followed or independently adopted by Calvin. The disciples of the former were called Zwinglians and Sacramentarians; they, however, preferred the name Evangelicals, which subsequently displaced the other two. They also ultimately shared in the name Protestants, which was originally limited to the German reformers.

It is simpler than the word zymine, originally proposed by Dr. Farr; and (what is much more important) to speak of a zymotic poison as a '*zyme*' does not imply the acceptance of any particular theory of disease, while, on the other hand, the use of the word 'germ' distinctly conveys the idea of some organised structure, itself the cause of disease by subsequent growth and multiplication."—*Dr. Horsley*, in *Quain's Dict. "To this body, this mother of the ferment, which has not at present been satisfactorily isolated, the name of *zymogen* has been applied. But it is better to reserve the term *zymogen* as a generic name for all such bodies as not being themselves actual ferments, may, by internal changes, give rise to ferments—for all 'mothers of ferment,' in fact."—*Foster: Physiol.* (ed. 4th), p. 271.

AN HISTORICAL SKETCH OF THE ENGLISH LANGUAGE, ITS ORIGIN, DIALECTS, STRUCTURE, AND AFFINITIES.

A spoken language is a number of different sounds made by the tongue and the other organs of speech: it may be written or printed upon paper or other material, by the aid of marks, signs, or symbols. Words are articulate sounds used to express perception and thought. The aggregate of these articulate sounds, accepted by and current among any community, is called *speech* or *language*. The language of the same community often presents local varieties: to these varieties is given the name of *dialects*. The growth of language is dealt with and taught by Comparative Grammar. By the aid of that science languages may be classified in two ways: (1) According to the peculiarities of their grammatical structure, or the mode of denoting the relations of words to one another; and (2) according to historical relationship. Historical relationship rests upon (*a*) the similarity of grammatical structure; and (*b*) the fundamental identity of roots. It may be shown by comparing the grammar and vocabulary of any two or more languages.

Before entering on an Historical Sketch of the English Language, it is necessary first to consider what the "English Language" is. Broadly speaking, it is the language spoken or written by the people of England from Anglo-Saxon times to the present. But "English" is not a fixed quantity to be marked out by strictly drawn limits or bounds.

To take a familiar illustration, the English language may be likened to the effect produced on a calm, smooth body of water when a stone is thrown into it. There is the well-defined centre, from which issue ripples, large at first, but gradually diminishing and becoming fainter and fainter, till at last it is impossible to say where they end, and where the water becomes smooth and calm again. So it is with the language. It is very rarely possible to define the exact time at which a word became a unit of the English language, while to determine the date when a word became obsolete is well nigh, if not actually, impossible. To some a word may appear dead, while to others it still lives. But the process of decay and renovation is continually going on; old words die gradually out, new words press in to take their places.

It will thus be seen that it is impossible to define "English" by any strict line or definite limits. It is the same with all languages:

"All living language is in a condition of constant growth and change. It matters not to what part of the world we may go: if we can find for any existing speech a record of its predecessor at some time distant from it in the past, we shall perceive that the two are different—and more or less different, mainly in proportion to the distance of time that separates them. It is so with the Romanic tongues of southern Europe, as compared with their common progenitor the Latin; so with the modern dialects of India, as compared with the recorded forms of speech intermediate between them and the Sanskrit, or with the Sanskrit itself; and not less with the English of our day, as compared with that of other days. An English speaker even of only a century ago would find not a little in our every-day speech which he would understand with difficulty, or not at all; if we were to hear Shakespeare read aloud a scene from one of his own works, it would be in no small part unintelligible (by reason, especially, of the great difference between his pronunciation and ours); Chaucer's English (500 years ago) we master by dint of good solid application, and with considerable help from a glossary; and King Alfred's English (1000 years ago), which we call Anglo-Saxon, is not easier to us than German. All this, in spite of the fact that no one has gone about of set purpose to alter English speech, in any generation among the thirty or forty that have lived between us and Alfred, any more than in our own. Here, then, is another side of the life of language for us to deal with, and to explain, if we can. Life, here as elsewhere, appears to involve growth and change as an essential element; and the remarkable analogies which exist between the birth and growth and decay and extinction of a language and those of an organized being, or of a species, have been often enough noticed and dwelt upon: some have even inferred from them that language is an organism, and leads an organic life, governed by laws with which men cannot interfere."*

And this continued change is not confined to alterations of the uttered and audible forms of words: it applies as well to alterations in the outward forms of words, as to changes in meaning. A word may change its form to any extent, without change of meaning, as well as change its meaning without change of form. Just as it is the case with organic beings, the growth of which consists in removal and re-supply, so it is with language.

"Existence, in speech, is use; and disuse is destruction. . . . If anything that people once thought and talked about comes to concern them no longer, its phraseology goes into oblivion—unless, of course, it be preserved, as a memory of the past, by some of those means which culture supplies. . . . The technical terms of chivalry mostly fell out as those of modern warfare came in; those of astrology, as this was crowded from existence by astronomical science. Only, we have here and there, not always consciously, in our present speech, reminiscences of the old order of things, in the shape of words transferred to new uses. . . . But, in the second place, words are crowded out of use, and so out of life, by the coming into use of other words which mean the same thing, and which for some cause, definable or not, win the popular favor, and supplant their predecessors. . . . By these means, there is in every language a certain amount of obsolescent material, in various stages: some words that are only unusual, or restricted to particular phrases (like *stead*, in *in stead* alone); some that belong to a particular style, archaic or poetical; some that have become strange and unintelligible to ordinary speakers, though formerly in every-day use; some that survive only in local dialects. And the older records of any tongue, if preserved, show words in greater or less number that are gone past recovery."†

But this loss in a language is more than counterbalanced by the acquisition of new material, new inventions, new trades, new ideas, all of which give rise to new words, terms, or phrases.

"A language like ours—since we come in contact with nearly all the nations of the world, and draw in to ourselves whatever we find of theirs that can be made useful to us, and since even our culture derives from various sources—comes to contain specimens from dialects of very diverse origin. Thus, we have religious words from the Hebrew, as *sabbath*, *seraph*, *jubilee*; certain old-style scientific terms from the Arabic, as *algebra*, *alkali*, *zenith*, *cipher*, besides a considerable heterogeneous list, like *lemon*, *sugar* (ultimately Sanskrit), *sherbet*, *magazine*; from the Persian, *caravan*, *chess*, *shawl*, and even a word which has won so familiar and varied use as *check*; from Hindi, *calico* and *chintz*, *punch* and *toddy*; from Chinese, *tea* and *nankeen*; from American Indian languages, *canoe* and *mocassin*, *guano* and *potato*, *sachem* and *caucus*. . . . For this

* *Whitney: Life & Growth of Language*, ch. iii., pp. 33–4. † *Ibid:* ch. vi., pp. 99, 100–102.

preponderance, in one aspect, of the borrowed material in English speech, there are easily assignable reasons. The Norman invasion, leading to a long antagonism and final fusion of a French-speaking with a Saxon-speaking race, brought in by violence, as it were, a great store of French words, of Latin origin, and thus made it comparatively easy to bring in without violence a great many more." *

Another source of the enrichment of a language is the composition of words, the putting together of two independent elements to form a simple designation. The relation between the two elements may be of every variety: thus, a *headache* is a pain *in* the head; a *head-dress*, a dress *for* the head; a *headland*, a point of land *comparable to* a head; a *headsman*, a man for *cutting off* heads. Another is the turning of nouns and adjectives into verbs: thus we say *harden, roughen, demoralize*, &c.; and we even turn one part of speech directly into another without using any external sign of the transfer: thus we say, to *chair* a candidate; to *hand* a book; to *table* a resolution; to *wire* a message; to *toe* a mark, &c. The suffixes *-ism, -ist*, ultimately of Greek origin, and imported through the French, have made themselves part of our living apparatus of derivation, in many cases abused, as in such monstrosities as *walkist, cueist*, &c.

The corruptions which words have undergone are of many and various kinds. Most of them are, doubtless, due to the influence of the wear and tear of

> "Time, whose slippery wheel doth play
> In humane causes with inconstant sway,
> Who exiles, alters, and disguises words."
>
> *Sylvester: Du Bartas*, p. 173 (1621).

The Rev. A. S. Palmer † arranges corrupted words under the following analytical groups:

1. Words corrupted so as to be significant, and in some sense appropriate; such as *acorn, ambergrease, battlement, belfry*, &c.
2. Words corrupted so as to convey a meaning, but one totally inappropriate, though sounding familiarly to the ear; such as *battle-door, cheese-bowl, featherfew, titmouse, wheatear*, &c.
3. Words corrupted so as to give rise to a total misconception, and consequently to false explanations, such as *attic, humble-pie, hurricane, husband*, &c.
4. Words, which, though not actually corrupted from their true shape, are suggestive of a false derivation, and have been generally accepted in that mistaken sense; such as *colonel, cozen, hawker, world*, &c.

Of words purely invented for some special substance, thing, or condition, language presents but rare examples. Special words or terms are frequently proposed to meet special circumstances, but they seldom survive. *Gas*, however, is an instance of such a word which has passed into common speech. The same chemist who devised *gas*, also suggested *blas* for that property of the heavenly bodies whereby they regulate the changes of time, but it failed to gain acceptance, and soon dropped out of sight and was forgotten. A new word must supply an antecedent blank; or else it ought, on the score of exactness, perspicuity, brevity, or euphony, to be an improvement on a word already existing.

"The use of new terms," says Webster, "is dictated by necessity or utility; sometimes to express shades of difference or signification, for which the language did not supply a suitable term; sometimes to express a combination of ideas by a single word, which otherwise would require a circumlocution. These benefits, which are often perceived, as it were, instinctively by a nation, recommend such words to common use, till the cavils of critics are silenced by the weight of authority" (*Letter to J. Pickering*, 1817, p. 7.)

Few suggested new words fulfil these requirements. Science, art, and manufactures contribute the majority of new words to the language. When some new process, machine,

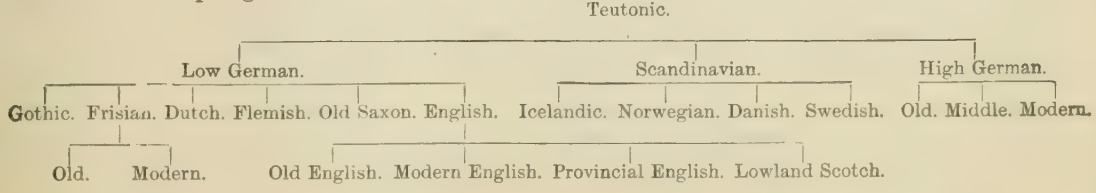
* *Whitney: ut supra*, ch. vii., pp. 115, 118. † *Folk Etymology, Introduction*, p. xxvii.

instrument or the like appears, necessarily a new word is required by which to designate it, as *phonograph, telephone, telpherage,* &c.

"When *galvanism, ozone,* and *chloroform* were discovered, and when *locomotives* and *stereoscopes* were invented, it was necessary to have names for them. *Cult* is a term, which, as we value exactness, we can ill do without, seeing how completely *religion* has lost its original signification. *Civility,* formerly the substantive of both *civil* and *civilize* . . . was judiciously relieved of one of its meanings, by *civilization. Financial, international, noticeable,* and *pretentious,* enable us to dispense with periphrases."*

Collide, diplomatist, executive, insularity, monograph, physicist, and *specie,* are instances of words proposed to fill existing blanks, and readily adopted. Political life and changes at times give origin to new terms, as witness *Adullamite, closure, jingo,* but they seldom long survive the occasion for which they were invented. With these we may connect *Boycott, tenant-right, Home-Rule, Fenian,* &c. Occasionally some notorious act gives rise to a new word, which finds general adoption, as to *Burke.*

The English language is shown by Comparative Grammar to belong to a group of allied languages to which the name Teutonic has been given. Its philological affinities are with the languages of Germany, Holland, and Scandinavia, rather than with the native languages of the British Isles. These last have been wholly superseded in the southern, central, and eastern parts of Great Britain. In Wales, however, the British is still spoken; as is Gaelic, or Erse, in Ireland and in the Highlands of Scotland. The *Teutones* or *Teutons* were a tribe of Germans, who were subdued by the Roman General Marius, B.C. 100. the terms *Teutonicus* and *Theoticus* were afterwards applied to the Germanic people of Europe generally, and the term *Teuton* or *Teutonic* is now used to denote Germans, Dutch, Scandinavians, and those of Anglo-Saxon descent, as opposed to Celts. By the Germans their own language is still called *Deutsch,* of which *Dutch* is only another form. The Teutonic group of languages may be divided into three main sections or groups, from which all the others spring. These are:



Teutonic.
Low German.
Scandinavian.
High German.
Gothic. Frisian. Dutch. Flemish. Old Saxon. English. Icelandic. Norwegian. Danish. Swedish. Old. Middle. Modern.
Old. Modern.
Old English. Modern English. Provincial English. Lowland Scotch.

I. Low German. Of *Gothic,* the oldest and most primitive of the Teutonic dialects, almost the sole record surviving is the translation of the Bible made by Bishop Ulphilas (A.D. 318-388) of which we possess some considerable portions of the Gospels and St. Paul's Epistles, some pieces of the Old Testament, and a small portion of a Commentary. It was spoken by the Eastern and Western Goths, who occupied the province of Dacia, whence they made incursions into Asia, Galatia, and Cappadocia.

Old Frisian is exemplified by documents of the twelfth and thirteenth centuries. *Modern Frisian* is still spoken in Friesland, along the coasts and islands of the North Sea, between the Weser and the Elbe, and in Holland and Sleswick. This dialect is more closely allied to English than any other of the Low German Languages. There is, indeed, a well-known couplet, every word in which is both Frisian and English:

"Good butter and good cheese
Is good English and good Fries."

* *Fitzedward Hall: Modern English,* ch. vi., p. 172.

Old Saxon had its origin in the districts of Munster, Essen, and Cleves, and was spoken between the Rhine and the Elbe. The most important composition in the Old Saxon dialect is a poetical version (of the ninth century), of the Gospels entitled the *Heljand* (= Old English *Heiland* = the *Healer* or Saviour). The following is an extract:

The Old Saxon is very closely allied to English, retaining many Teutonic inflexions that have disappeared from other Low German dialects.

II. Of the Scandinavian dialects the *Icelandic* is the purest and oldest. Old Icelandic, from the eleventh to the thirteenth century is often called "Old Norse," but this term belongs properly to Old Norwegian.

III. High German is divided into three stages, of which the *Old High German* comprises a number of dialects spoken in Upper or South Germany from the beginning of the eighth to the middle of the eleventh century; *Middle High German* was spoken in Upper Germany from the beginning of the twelfth to the end of the fifteenth century; and *Modern* (or *New*) *High German* from the end of the fifteenth century to the present time.

The Teutonic dialects form a sub-division of that great family of related languages known as Indo-European, from its comprehending not only nearly all the languages of Europe, but also those Indian dialects which have sprung from the Sanscrit: the term Aryan (= honourable, noble) is also sometimes applied to the family.

This Indo-European (or Aryan) family of languages has two great divisions:

I. The EUROPEAN DIVISION:

1. The Teutonic Languages.
2. The Celtic (or Keltic) Languages, consisting of (1) The *Cymric* class, consisting of (*a*) *Welsh*, (*b*) *Cornish* (died out about middle of sixteenth century), (*c*) *Bas-Breton*. (2) The *Gaelic* (or *Gadhelic*) class, consisting of (*a*) *Erse* or *Irish*, (*b*) *Gaelic* (spoken in the Highlands of Scotland), (*c*) *Manx* (spoken in the Isle of Man).
3. The Italic (or Romanic) Languages, comprising (1) The *Old Italian dialects*, as Oscan, Umbrian, Sabine. (2) The *Romanic dialects*, which have sprung from the Latin, comprising (*a*) *Italian*, (*b*) *French*, (*c*) *Provençal*, (*d*) *Spanish*, (*e*) *Portuguese*, (*f*) *Roumansch* (spoken in southern Switzerland), (*g*) *Wallachian* (spoken in Wallachia and Moldavia).
4. The Hellenic Languages, comprising (1) *Ancient Greek* (with its various dialects: Attic, Ionic, Doric, and Æolic). (2) *Modern Greek*.
5. The Sclavonic Languages, comprising (1) *Bulgarian*. (2) *Russian*. (3) *Illyric*. (4) *Polish*. (5) *Bohemian*. (6) *Slovakian*. (7) *Upper and Lower Sorbian*. (8) *Polabian* (on the Elbe).
6. The Lettic Languages, comprising (1) *Old Prussian*. (2) *Lettish* (or *Livonian*). (3) *Lithuanian*.

II. The ASIATIC DIVISION:

Sanscrit, Prakrit, Pali, Modern Indian Dialects, Gypsy Dialect, Zend, the Cuneiform Inscriptions of Darius, Xerxes, and their successors, Parsi, and Modern Persian.*

The people who spoke the old and primitive tongue from which all these languages have sprung "must have lived together as one great community more than 3,000 years ago. It was formerly held that tradition, as well as the evidence of language, pointed to the north-eastern part of the Iranian table-land, near the Hindu-Kush mountains, as the original abode of this primitive people;" but a more recent view is that Europe (probably Southern Scandinavia), and not Asia, was the primal seat of the Aryans.†

To recapitulate, English (1) is a member of the Indo-European family; (2) belongs to the Teutonic group; (3) is a Low German dialect; and (4) was brought into Britain by wandering tribes from the Continent, about A.D. 449, according to Bede, who makes the invaders consist of three tribes, Angles, Saxons, and Jutes. The first of these came from the duchy of Sleswick;‡ the Saxons from the country between the Elbe and the Eider; and the Jutes from the upper part of Sleswick, or South Jutland. With these there was no doubt a considerable intermixture of Frisians.

The settlements were probably made in the following order:

1. Jutes, under Hengest and Horsa, settled in Kent, the Isle of Wight, and a part of Hampshire, A.D. 449 or 450.
2. The first division of Saxons, under Ella and Cissa, settled in Sussex, A.D. 477.
3. The second division of Saxons, under Cerdic and Cynric, settled in Wessex (comprising Hampshire, Berkshire, Wiltshire, Somersetshire, Dorsetshire, Gloucestershire, and Devonshire), A.D. 495.
4. The third division of Saxons settled in Essex, A.D. 530.
5. The first division of Angles settled in East Anglia (comprising Norfolk, Suffolk, Cambridgeshire, and parts of Lincolnshire and Northamptonshire).
6. The second division of Angles, under Ida, settled in the kingdom of Beornicia (between the Tweed and the Firth of Forth), A.D. 547.

"Two other kingdoms were subsequently established by the Angles—*Deira* (between Tweed and Humber), and *Mercia* [=march or frontier], comprehending the Midland counties.

"Teutonic tribes were known in Britain, though they made no settlements before the coming of the Jutes. In the fourth century they made attacks upon the eastern and south-eastern coast of this island, from the Wash to the Isle of Wight, which, on that account, was called '*Littus Saxonicum*,' or the Saxon

shore or Saxon frontier; and an officer known as the Count of the Saxon Shore (*Comes Littoris Saxonici per Britannias*) was appointed for its defence. These Teutonic invaders were known to the Romans and Celts by the name of *Saxons*; and this term was afterwards applied by them to the Teutonic settlers of the fifth century, who, however, never appear to have called themselves Saxons, but always Æniglisc or English."*

CELTIC ELEMENT.

Very few words were borrowed by the invaders from the original inhabitants (Celts or Kelts): *basket, brag, bludgeon, bodkin, bother, bots, cairn, darn, shamrock, clan, claymore, spate, brose,* and, through the French, *baggage, bar, barrel, gravel, glebe, pickaxe, pottage, pouch, rogue, tan, truant,* are examples.

Garnett† gives a list of nearly two hundred of these words, many of which belong to household management; and others, such as *spree, bane, whop, balderdash,* &c., can scarcely be reckoned Classical English. The few survivals tend to show how complete was the extermination of the Celts; they prove that "the Celtic women were kept as slaves, while their husbands, the old owners of the land, were slaughtered in heaps."‡

LATIN ELEMENT.

What is called the *Latin of the First Period*, as incorporated into English, consists only of a few words that exercised no influence on the language, being found only in names of places, as *castra* = a camp, found in *Chester*, Don*caster*, Man*chester*, Win*chester*, Tow*cester*, &c.

About A.D. 596 the English were converted to Christianity, and during the four following centuries many Latin words were introduced by the Latin missionaries and by English translators of Latin works into their own language. This is known as the *Latin of the Second Period.* Examples are *priest* (from *presbyter*); *sacrament* (from *sacramentum*); *calic* (from *calix* = a cup); *church*, &c. Also a few adopted Greek words, as *bishop* (from ἐπίσκοπος = an overseer), *apostle, monk, angel,* &c.; and some names of articles of commerce, as *butter* (*butyrum*), *cheese* (*caseus*), *tunic* (*tunica*), *lettuce* (*lactuca*), *pound* (*pondus*), *candle* (*candela*), *trout* (*trutta*), &c.

SCANDINAVIAN ELEMENT.

In the year 787 the Northmen, Norsemen, or Normans, of Scandinavia, *i.e.*, of Denmark, Norway, and Sweden, began to make descents on the eastern coast of England, Scotland, the Hebrides, and Ireland. These attacks went on for three centuries. In the ninth century these Danes obtained a permanent footing in the northern and eastern parts of England, subduing the kingdoms of Northumbria, East Anglia, and Mercia; and by the eleventh century they had become so strong that Danish kings sat on the throne of England from A.D. 1013 to 1042.

The traces of Scandinavian influence on the English Language are numerous, and may be classed under three heads: (1) names of places; (2) in the Old English Literature of the North of England; and (3) in the Northern Provincial Dialects. Under the first head come the suffixes *-by* = a town, as in Grims*by*, Whit*by*, &c.; *-fell* (Icel., *fjall, fell*) = a hill or table-land, as in Scaw*fell*, Cross*fell*, &c.; *-dale* a = valley; *-thwaite* = a forest clearing;

* *Morris: Hist. Outlines of English Accidence*, ch. iii. p. 18. † *Philological Essays*, p. 161.
‡ *Kington Oliphant: Sources of Standard English*, p. 19.

-toft = a homestead, as in Lowes*toft*; *-wick* = a creek, a bay, as in Ips*wich*, Ber*wick*, &c.; *-oe*, *-ea* (Icel. *-ey*) = an island (*eyot*), as in Faro*e*, Chelse*a*; *-ness* = a cape (or nose), as in Caith*ness*, Fife*ness*, the *Naze*, &c. Besides these there are a good many common words of undoubted Danish origin, such as *are*, *till*, *until*, *fro*, *froward*, *ill*, *bound* (for a place), *bask*, *busk*, &c.

It is thus seen that the Anglo-Saxon was a composite tongue, formed by the gradual blending of several kindred dialects, principally introduced into England between the middle of the fifth and the middle of the sixth century, with a considerable infusion of Latin derived from the Romanised Britons. The Anglo-Saxon was an inflected or synthetic language, like the Latin and Greek. It had five cases. The article, noun, adjective, and pronoun were declinable, having different forms for three genders and two numbers: the adjective, as in German, had two inflections, the definite and the indefinite; the verb had four moods, the indicative, subjunctive, imperative, and infinitive, and but two tenses, the present, or indefinite (used also as a future), and the past. There were also compound tenses in the active voice, and a passive voice, formed, as in English, by auxiliaries. The auxiliaries usually retained their force as independent verbs, and were not employed as mere indications of time, as in English. The Anglo-Saxon had ten forms for the article, five for the noun, and ten terminations for the positive degree of adjectives; the irregular verbs had thirteen endings, without including the inflected cases of the participles.

The Anglo-Saxon language attained its height during the reign of Alfred (870–901).

In Anglo-Saxon poetry the distinctive feature was alliteration, the rule of which, stated in general terms, was as follows: In each couplet, three emphatic words (or by poetic licence accented syllables), two in the first line (or half-line), and one in the second, must commence with the same consonant, or with vowels, in which case the initials might be, and generally were, different.

The event which exercised the greatest influence on the English Language was the Norman Invasion in 1066. Through it French became the language of the Court, of the nobility, of the clergy, of literature, and of all who wished or sought for advancement in Church or State. From the Normans are derived most of the terms connected with

1. Feudalism & War.—*Aid, arms, armour, assault, banner, baron, captain, chivalry, duke, fealty, fief, homage, lance, tournament, vassal,* &c.
2. The Church.—*Altar, Bible, baptism, ceremony, friar, homily, piety, penance, prayer, preach, sermon, sacrifice, saint, tonsure,* &c.
3. The Law.—*Assize, attorney, case, cause, chancellor, court, estate, fee, felony, judge, jury, plaintiff, plea, plead, statute, sue, tax, ward.*
4. The Chase.—*Bay* (2), s., *brace, chase, couple, course, covert, falcon, leveret, quarry, rabbit, reynard, venison,* &c.

For all this, as Robert of Gloucester says:

"Lowe men holdeth to Englyss, and to her kinde speche yute."
("The lower classes cling to English, and to their native tongue yet.")

The most important changes due to French influence are: (1) c before the Conquest was pronounced hard, like k, after the Conquest it assumed a soft sound like *s*, and also the softened sounds of *ch*, *sh*; (2) s, which was the general plural termination of French nouns, became the received sign of the plural in English; and (3) *-th*, the ending of the third person singular of the present indicative, was gradually softened to *s*.

In process of time the two races—the conquerors and the conquered—coalesced, and became one people, the language of the majority prevailing, so much so, that in 1349 Latin ceased to be taught in schools through the medium of French,* and in 1362 it was enacted by Act of Parliament that all pleadings in the law courts should henceforth be conducted in English, because, as is stated in the preamble to the Act, French was becoming so much unknown in the kingdom that persons who were parties to suits had no knowledge or understanding of what was said for or against them by the pleaders.

The Norman-French was essentially a Latin tongue, and through it was added to the English another Latin element, usually termed the *Latin of the Third Period.*†

The Latin element is thus seen to have entered the language either *directly* or *indirectly: indirectly* in the first three periods, and *directly* in the fourth period. We frequently find two forms of the same word, one taken *indirectly*, the other *directly* from the Latin:—

Indirectly, through Norman-French.	*Directly borrowed from the Latin.*	*Latin.*

* Trevisa (*Polycronicon*, ii. 157) fixes the time of the great plague of 1349 as the point after which the popular fancy for speaking French began to abate. He says: "As hyt ys yknowe houȝ meny maner people buþ in þis ylond, *þer* buþ also of so meny people longages & tonges; noþeles Walschmen & Scottes, þat buþ noȝt ymelled wiþ o*þer* nacions, holdeþ wel nyȝ here furste longage & speche, boteȝef Scottes, þat were som tyme confederat & wonede wiþ þe Pictes, drawe somewhat aft*er* here speche. † The title of *Latin of the Fourth Period* is given to the large number of Latin words introduced into the language from the revival of learning in the beginning of the sixteenth century up to the present time.

We also borrowed words from the Greek, but to a much less degree, while miscellaneous words have become naturalized from other languages, as, from Hebrew (*abbot, amen, cabal, cherub, sabbath,* &c.), from Arabic (*admiral, alchemy, alkali, arrack, assassin, caliph, chemistry, talisman, zenith,* &c.), from Persian (*caravan, chess, dervish, orange, pasha, sash, shawl, turban,* &c.), from American (*canoe, cocoa, hammock, maize, tobacco, tomahawk, wigwam,* &c.), and from Turkish (*caftan, chouse, divan, scimitar,* &c.). In short, we have borrowed from almost every language under the sun such words as are appropriate to materials or productions new to us.

Before the Norman Conquest there were *two* dialects in England—the Northern and the Southern. The former has handed down to us a very scanty literature, while the latter was the literary language of the country, and in it were written the best of our oldest English works, many of which have come down to us. Dr. Morris gives the following as the chief points of grammatical difference between the two dialects:*

(1) The loss of *-n* in the infinitive ending of verbs:
N. *drinc-a,* S. *drinc-an* = to drink.

(2) The first person singular indicative ends in *-u* or *-o,* instead of *-e:*
N. *Ic drinc-o.* S. *drinc-e* = I drink.

(3) The second person singular present indicative often ends in *-s,* rather than in *-st,* and we find it in the second person singular perfect indicative of weak verbs:
N. *dhu ge-plantad-es.* S. *ge-plantad-est* = thou hast planted.

(4) The third person singular frequently ends in *-s* instead of *-th:*
N. *he gewyrces.* S. *gewyrcath* = he works.

(5) The third plural present indicative and the second person plural imperative often have *-s* instead of *-th:*
N. *hia onfoas.* S. *hi onfoath* = they receive.

(6) The occasional omission of *ge-* before the passive participle:
N. *hered.* S. *geherod* = praised.

(7) The occasional use of active participle in *-and* instead of *-end:*
N. *driņcande.* S. *drincende* = drinking.

(8) The use of *aren* for *syndon* or *synd* = are (in all persons of the plural).

In nouns there is much irregularity as compared with the Southern dialect:

(9) Plurals end in *-a, -u, -o,* or *-e,* instead of *-an:*
N. *heorta.* S. *heortan* = hearts.
N. *witegu.* S. *witegan* = prophets.
N. *ego.* S. *eagan* = eyes.
N. *nome.* S. *naman* = names.

(10) *-es* is sometimes found instead of *-e* as the genitive suffix of feminine nouns.

(11) *the* and *thio* are sometimes found for *se* (masc.) and *seo* (fem.) = the

(12) The plural article *tha* sometimes occurs for the demonstrative pronoun *hi* = they.

The oldest specimen of English known is preserved in a quotation by the Venerable Bede (672–735) from the composition of an early contemporary, Cædmon, a monk of Durham.† It is here given in two versions:

Nu scylun hergan	Nu we sceolan herigean	Now we should praise

xxxii. That the proud and puffed up in spirit are to be admonished in one way, and in another the humble and faint-hearted.

The proud and presumptuous are to be admonished in one way, in another the humble and diffident. The presumptuous when too confident in themselves, despise and revile others. The faint-hearted and diffident, perceiving their want of courage and strength, often despair. The proud and presumptuous think that all their own special thoughts and deeds are the best; but the humble and timid think that what they do is very contemptible, and therefore despair. But the teacher must very narrowly investigate the works of the presumptuous, that they show them that in the things wherein they please themselves so much they displease God.

The following extract from an entry in the *Anglo-Saxon Chronicle*, under the year 1137, shows the progress of the language:—

(*Anglo-Saxon Chronicle.*)

I neither can nor may tell all the wounds or all the tortures which they inflicted on wretched men in the land; and that lasted the nineteen winters that Stephen was king; and ever it was worse and worse. They laid imposts on the towns continually, and called it "censerie." When the wretched men had no more to give, they robbed and burned all the towns, so that thou mightest well go a day's journey and thou shouldst never find a man sitting in town, or the land tilled. Then was corn dear, and flesh, and cheese, and butter; for there was none in the land. Wretched men died of hunger; some went seeking alms who at one while were rich men; some fled out of the land.

The following extract from the *Ancren Riwle* (= *Rules for Anchorites*) gives an example of West Saxon (Dorsetshire) dialect about 1220.* It illustrates an early stage of the transition from Anglo-Saxon to English:

Backbiters, who bite other men behind [their backs] are of two kinds, but the latter [kind] is the worse. The former cometh quite openly, and sayeth evil of another, and speweth out his venom, as much as ever comes to his mouth, and throweth out, all at once, what the venomous heart sends up to their tongue. But the latter comes out quite in a different way, and is a worse fiend than the other, yet under the cloak of a friend. He casteth down his head, and begins to sigh before he says anything, and makes sad cheer, [and] moralizes long about [the point] to be the better believed. But, when it all comes forth, then is it yellow venom.

By the thirteenth and fourteenth centuries it is possible to distinguish three great varieties of English:

(1) The Southern dialect, spoken in all the counties south of the Thames, in Somersetshire, Gloucestershire, and in parts of Herefordshire and Worcestershire.

(2) The Northern dialect, spoken in Northumberland, Durham, and Yorkshire, and in the Lowlands of Scotland.

(3) The Midland dialect spoken in the whole of the Midland counties, in the East Anglian counties, and in the counties west of the Pennine chain, *i.e.*, in Cumberland, Westmoreland, Lancashire, and Shropshire.

The most convenient test by which to distinguish these dialects from one another is the inflection of the plural present indicative: the Southern dialect employs *-eth*; the Midland *-en*; the Northern uses *-es*. The Northern dialect has its imperative plural in *-es*; the Southern and Midland dialects in *-eth*.

The Southern dialect was fond, as it still is, of using *v* where the other dialects used *f*, as *vo* = *fa* = foe, *vinger* = finger, &c. In the Old Kentish of the fourteenth century *z* was used for *s*, as, *zinge* = to sing. The Northern dialect used the guttural *k* in many words where the Southern preferred the palatal *ch*, as:

N. *rike* = S. *riche* = kingdom. N. *croke* = S. *crouche* = cross.

The Southern dialect often had *ō* and *u*, where the Northern had *ā* and *i*:

N. *hil* = S. *hul* = hill. N. *pit* = S. *put* = pit. N. *án* = S. *ón* (*oon*) = one.

In the Northern dialect *-at* = to, was used as a sign of the infinitive mood:

N. *sal* and *suld* = S. *schel* and *schuld*.

The Northern dialect contained many Scandinavian forms, as:

N. *hethen* = S. *henne* = hence.
N. *fra* = S. *fram* = from.
N. *-by* = S. *tun* = town.
N. *til* = S. *to* = to.
N. *slik* = S. *swich* = such.
N. *werre* = S. *wyrse* = worse.

The Midland dialect has various forms, of which (1) the East Midland (spoken in Lincolnshire, Norfolk, and Suffolk) and (2) the West Midland (spoken in Cumberland, Westmoreland, Lancashire, Cheshire, and Shropshire) are most marked.

* Edited for Camden Society by Rev. J. Morton, B.D., 1853, pp. 86–88.

The East Midland dialect had one especial peculiarity, viz., the coalescence of pronouns with verbs, and even with pronouns, as:

caldes = *calde* + *es* = called them. *get* = *ge* + *it* = she + it.
hes = *he* + *es* = he + them. *mes* = *me* + *es* = one (Fr. *on*) + them.

The West Midland had its peculiarities, as *ho* = she; *hit* = its; *shyn* = shuln (plural).

The Midland dialect was the form of speech which culminated in the present literary English. As stated above it had many varieties, but the most important was the East Midland. As early as the beginning of the thirteenth century it had thrown off most of its older inflections, and had begun to be cultivated as a literary dialect. In this dialect Wycliffe, Gower, and Chaucer wrote, as well as the older and well-known authors, Orm (or Ormin) and Robert of Brunne. It was, however, Chaucer's influence that raised this dialect to the position of a standard language. In Chaucer's time it was the language of the metropolis, and had probably found its way south of the Thames into Kent and Surrey.

At a later period the Southern dialect had so far retreated before it as to become *Western* rather than *Southern;* in fact, the latter designation was applied to the language which had become the standard one.

George Puttenham (*Art of English Poetrie*), writing in 1589, speaks of three dialects —the Northern, Western, and Southern.* The Northern was that spoken north of the Trent; the Southern was that south of the Trent, which was also the language of the court, of the metropolis, and of the surrounding shires; the Western, as now, was confined to the counties of Gloucestershire, Somersetshire, Wiltshire, &c.†

The celebrated Proclamation of Henry III. (1258) is by many considered the earliest specimen of composition in the English tongue.‡

To make the distinction between the dialects more clear, the following specimens, all representing the language of the same half-century are given:—

1. Southern Dialect.—Of this the following quotation from the *Ayenbite of Inwyt* (= *The Remorse of Conscience*), by Dan Michael of Northgate (Kent), c. A.D. 1340, is an example:§

(*Sermon on Matthew xxiv.* 43.)

I say not this but that in every shyre of England there be gentlemen and others that speake but specially write as good Southerne as we of Middlesex or Surrey do, but not the common people of every shire, to whom the gentlemen and also their learned clarkes do for the most part condescend, but herein we are already ruled by th' English dictionaries and other bookes written by learned men."

2. Northern Dialect.—The following extract from the *Early English Psalter*, from a MS. written about the middle of the reign of Edward II.,† represents the speech of Yorkshire and Northumberland during the latter half of the thirteenth century:

Laverd, oure Laverd, hou selkouth is
Name þine in alle land þis.

From *The Pricke of Conscience* (ll. 1412-1446), by Richard Rolle de Hampole (died A.D. 1349), written c. 1340 (Northumberland dialect):‡

And ful variand and chaungeable,

3. Midland Dialects: (1) *East Midland.*—The following is an example of the East Midland dialect in the year 1120. It is taken from a forged Peterborough Charter, inserted in the *Peterborough Chronicles* under the year 656:

Ða cwæd se kyning to þan abbode: "La, leof Sæxulf, ic haue geseond æfter þe for mine saule þurfe, and ic hit wile þe wæl secgon for whi min broðor Peada and min leoue freond Oswi ongunnen an mynstre Criste to loue and Sancte Petre. Ða feorde se abbot ham, and ongan to wircene.

Then the king sent after the abbot that he should come to him speedily, and he did so. Then said the king to the abbot, "Lo, dear Sæxulf, I have sent after thee for my soul's need, and I will tell thee well why my brother Peada and my dear friend Oswi began a minster to the glory of Christ and St. Peter. But my brother is gone from this life, as Christ willed it. But I will pray to thee, my dear friend, that they may work diligently in the work, and I will find thee thereto gold and silver, land and goods, and all that thereto behoves." Then went the abbot home, and began to work.

We next give an extract from the writer, who, says Mr. Kington Oliphant,§ more clearly than any other sets before us the growth of the New English, the great work of

the twelfth century. The Monk Ormin wrote a metrical paraphrase of the Gospels, with comments of his own, somewhere about the year 1200. . . . He is the last of our English makers who can be said to have drunk from the undefiled Teutonic well. In the course of his lengthy poem (over 20,000 lines) he uses only four or five French words, and his few Latin words are Church phrases known in our land long before the Norman Conquest. On the other hand, he has scores of Scandinavian words, the result of the Norse settlement in our eastern shires three hundred years before his day. His book is the most thoroughly Danish poem ever written in England that has come down to us: many of the words now in our mouths are found for the first time in his pages. He probably lived some few miles north of Nottingham. In his poem we see clearly the transition to the Middle English of Chaucer, Gower, Wycliffe, &c. He uses the new soft *ch*, and writes *sh* for the older *sc*. He softens *g* into *y*, as in *eȝhe* = *eage* = eye; *ȝung* = *geong* = young; he uses *that* as a demonstrative, and not as a neuter article; he does not inflect the article, in this respect being far ahead of the Kentish writer of 1340. Ormin was the first English writer to put *what* before a substantive without regard to gender: as, "*What* man? *What* woman?" He uses *aren* for *are*, as well as *beon* and *sinndenn*. *Hi wæron* with him sometimes becomes *þeȝȝ wære*, as in the Southern Homilies; while *þu wære* is turned into *þu wass*, and *ic sceall* becomes *I shall*. *Beó* is cut down to *be*, and *beon* to *ben*. Ormin was an orthoëpist of Nature's own making, and in his system of spelling we have the first known attempt at orthoëpical reform in the history of our tongue. The principal peculiarities of his orthography consist in a doubling of the consonant whenever it follows a vowel having any sound except that which is now indicated by the annexation of a final *e* to the single consonant. Thus, *pane* would be written *pan* by Orm, but *pan, pann; mean, men*, but *men, menn; pine, pin*, but *pin, pinn; tune, tun*, but *tun, tunn*. The versification departs from the Anglo-Saxon standard, in wanting alliteration and in possessing a regular metrical flow; and from the Norman-French in wanting rhyme.

In the *Handlyng Synne*,* a translation by Robert Manning, otherwise known as Robert of Brunne (*i.e.*, Bourne, a village a few miles from Rutland), from a French poem, the *Manuel des Péchés*, written by William of Waddington about thirty years before, we see foreshadowed more clearly than in any other work the course which English Literature was destined to take. The English poem differs from all its predecessors in its vocabulary, for it contains but a scanty proportion of those Teutonic words which were soon to fall out of use, and a most copious proportion of French words. It was begun about 1303. "The *Handlyng Synne* shows how the different tides of speech, flowing from Southern, Western, and Northern shires alike, met in the neighbourhood of Rutland, and all helped to shape the New English."†

In the following extract from an anonymous poem, known as *The Romance of William and the Werwolf* (ll. 3–11), we have an example of the dialect of Shropshire, circ. 1360:

Hit bifel in þat forest þere fast by-side,

We have now reached the point of time when the English Language, as we have it now, began to assume a fixed form. The three great writers, William Langland, the author of *The Vision of Piers Plowman* probably, Wycliffe, the reformer and translator of the Bible, and Chaucer, together developed that particular dialect (Midland) which ultimately became the literary form of the language. The interest and importance of the *Vision of Piers Plowman* depend not only on the excellence of its literary execution, and the insight which it gives us into the inner life of our ancestors, but also on the fact that it is the first composition in which the English spirit and genius are distinctly perceptible. Though written in a dialect, it heralded the speedy advent of the time when, under the lead of

Chaucer and Gower, the literary speech assumed a definite form and character. The *Vision* has come down to us in three texts, written respectively in 1362, 1377, and 1393.* The numerous MSS. of the work in existence show how widely it was circulated.† In one point it possesses for us a peculiar interest, viz., that it is written according to the old alliterative system of versification, being the last important composition written in that style. The author, whoever he was, was evidently connected with the clerical profession, as is indicated by the acquaintance with ecclesiastical literature displayed in the poem. He had an accurate knowledge of the Latin Scriptures, the Treatises of the Fathers, and the works of commentators and expositors.‡ His diction is more archaic than that of Chaucer, but the syntax, structure, and vocabulary present a marked resemblance. The following are the principal points in Langland's grammar:

I. *Nouns.*—The nominative plural generally ends in *-es*, sometimes in *-s*, and occasionally in *-ȝ*; *-is* also occurs, as in *wittis*, and very rarely *-us*, as in *folus*. Some few plurals end in *-en*, as *chylderen*. A few nouns, such as *folk*, which were originally neuter, are unchanged in the plural. Some plurals are formed by vowel change, as *gees*, *men*, *fete* (or *feet*). The genitive singular ends in *-es*, sometimes corrupted into *-is*, as *cattes*, *cattis*. The genitive plural ends in *-en* or *-ene*, as *clerken*. The dative singular commonly ends in *-e*, as to *bedde*.

II. *Adjectives.*—The distinction between definite and indefinite adjectives is difficult, owing to the irregularity of the alliterative rhythm, and the additions and corruptions of scribes and copyists. Plural adjectives should, and generally do, end in *-e*, as *alle*. Very rarely plural adjectives of French origin end in *-es*. The comparative of *heigh* is *herre;* superlative, *hexte*. Adjectives and adverbs ending in *-ly*, sometimes form their comparatives and superlatives in *loker*, *lokest*, as *light*, *lightloker*, *lightlokest*.

III. *Pronouns* are the same as in Chaucer, but besides *sche*, the older form *heo* is used, and besides *þei*, the older form *h* (hy). There are also traces of dialectic confusion and admixture in the use of the pronouns; *their* is denoted by *here*, *her*, or *hir; them* by *hem*, &c.

IV. *Verbs.*—The indicative plural ends both in *-en* and *-eth*, as *geten*, *conneth*. Thus, in *Passus*, iii. ll. 80–81, we find:

> For þese aren men on þis molde: þat moste harme *wercheth*
> To þe pore peple: that parcel-mele *biggen*.

He sometimes uses a singular verb with a plural noun, especially the verb *is* or *was*, as:

> Boþe lyf and lyme *is* lost from my speche. *Passus*, v. 99.

The abbreviated forms *sit* (= sitteth), *rit* (= rideth), *halt* (= holdeth), and the like, occur in Langland, as in Chaucer.§ The anomalous verbs and negative verbs (such as *nam* = am not, *nelle* = will not), adverbs, &c., are much the same as in Chaucer. The past tense of weak verbs which should end in *-ede*, ends, commonly, in *-ed* only, both in the singular and plural, as *pley-ed*, but sometimes the full plural form *-eden* occurs. In weak verbs, which should form their past tenses in *-de* or *-te*, the final *e* is often dropped. Thus, *went* for *wente*. In strong verbs, which should terminate (in the first and third persons singular of the past tense) in a consonant, we often find an *e* added; thus, I *shope* for I *shop*. The plural generally has the correct form, *-en*, as *chosen*. In the infinitive mood some verbs are found with the ending *-ie* or *-ye*, and final *e* is sometimes dropped. The present participle ends in *-yng*, as *worchyng*, but the ending *-inde* occurs occasionally; the prefix *y-* is often found before past participles, sometimes even before past tenses.

The next writer who exercised an important and decided influence in developing the particular dialect which has become the literary form of the English Language is Wyclif, or Wycliffe. John Wycliffe was born at the village of Hipswell, near Richmond, Yorkshire, about 1324, and died at the vicarage of Lutterworth, Leicestershire, in 1384. Besides the version of the Scriptures in his native tongue, Wycliffe was the author of a

large number of religious treatises written in English. His great work, the translation of the Bible, is supposed to have been completed about 1380. It was made from the Latin Vulgate. How much of the translation was the work of Wycliffe himself is rather doubtful; it is generally believed that a large portion of the older text (1380) is the work of Hereford, an English ecclesiastic, while the remainder of the Old Testament and the whole of the New Testament are undoubtedly by Wycliffe himself. A revised edition by Purvey was completed about 1390. Chaucer was probably indebted to Wycliffe for much of the wealth and beauty of his diction and orthography. The numerous MSS. of Wycliffe's translation of the Bible prove how widely it was circulated and how popular it became.*

The most important result of Wycliffe's translation was the formation of an English religious dialect, which, without any essential modifications, has remained the language of devotion and of Scriptural translation to this day. It enriched the English Language by the introduction of a large number of words derived either directly from the Latin, or indirectly from the Latin through the Norman-French. By their excellence and extensive circulation the works of Wycliffe contributed greatly to the importance of the East Midland dialect, and thus tended directly to secure for that speech pre-eminence as the standard form of the language. In various peculiarities of speech he differs from Chaucer and Maundeville, and in these we have followed him. The greatest is the Dano-Anglian custom of clipping the prefix to the past participle, as *founden*, instead of *y-founden*. He sometimes, although most seldom, clips the ending of the plural of the imperative, as in Herod's request to the wise men:

Whan yee hav founden, *telle* ayein to me.

He still uses the old *sum man* for *quidam*, but this was soon to drop, and to be replaced by *a certain man*. He corrupts Ormin's *þu wass* into *thou wast*. A remnant of the older speech lingers in his *nyle ye drede* (= fear not). In many points we have preferred Tyndale to Wycliffe, as in "He hath *endurid* [hardened] the herte;" "Father, *clarifie* thi name;" "I am sent to *evangelise* to thee thes thingis," &c. On the other hand, we have preferred Wycliffe to Tyndale in sundry passages, as:

Wycliffe.	*Tyndale.*
Sone of perdicioun.	That lost chylde.
It is good us to be here.	Here is good beinge for us.
Entre thou in to the joye of thi lord.	Go in into thy master's joye, &c.

Few of the words used in the Wycliffite version have become obsolete within the last five hundred years. Hereford, in his portion of the work, strove hard to uphold the Southern dialect. The following is from his version of Psalm ciii.:

7. Knowen he made his weies to Moises; and to the sones of Israel his willis.
8. Reewere and merciful the Lord, long abidende and myche merciful.
9. Into euermore he shal not wrathen, ne into withoute ende he shal threte.
10. Aftir oure synnes he dide not to vs, ne aftir oure wickidnessis he gelde to us.
11. For after the heigte of heuene fro erthe, he strengthide his mercy vpon men dredende him.

The other two translators, on the other hand, leant to the new standard, the East Midland dialect. They wrote *daunseresse*, &c., where Hereford wrote *daunster*, &c. They also used *-ing* as the ending of the present participle, where Hereford wrote the old *-ende*.†

* Wycliffe's translations, two versions, were edited by Rev. J. Forshall and Sir F. Madden in 1850.

John de Trevisa, from whose translation of Higden's *Polychronicon* (completed about 1387) the following extract is taken, was a native of Cornwall, but resided chiefly in Gloucestershire, being vicar of Berkeley and chaplain to Thomas, Lord Berkeley.

We have now arrived at the most important point in the history of the English Language. The commencement of literary English dates from the latter half of the fourteenth century, and from the writings of Chaucer and his contemporary, Gower. The language and literature which we have hitherto been considering are dialectic in character, as there was thus far no generally recognized standard of speech, and consequently no national literature. Having reached this important point, the rise of the Queen's English, it may be well, before proceeding further, to notice minutely the precise condition of the language used by Chaucer.

Born in London (c. 1340), Chaucer wrote in the East Midland dialect. This dialect, formed by the blending of Anglian and Danish terms and constructions, had gradually extended farther and farther southward, until it eventually supplanted the original Southern speech. Its complete ascendency was not, however, established till long after the time of Chaucer. His English, like that of the present day, is an uninflected or analytic language, differing in this respect from the language of his predecessors, and still more from that oldest form of English, known as Anglo-Saxon, which was originally inflected or synthetic, that is to say, it expressed grammatical relation by changes in the *forms* of words, instead of employing auxiliary words. The additions to the vocabulary of the English Language from the Norman-French formed no inconsiderable element in the *written* language when Chaucer wrote. He has been accused of corrupting the English Language by an unnecessarily large admixture of Norman-French terms, but in reality he, with few exceptions, employed only such terms as were in use in the *spoken* language, giving them the stamp of his authority and thus making them current coin of the literary realm. Of the French words found in his writings, few more than one hundred have become obsolete.

With the *Canterbury Tales* begins the modern period of English Literature. We have seen how Chaucer found the language, the following outline of his grammatical forms will show how he used it, and how he left it:*

I. *Nouns.*—1. The nominative plural, for the most part, terminated in *-es*—

And with his *stremës* dryeth in the *grevës*
The silver *dropës* hongyng on the *leevës*. *Knight's Tale*, 637, 638.

* Mainly condensed from Dr. Morris's *Introduction to Chaucer's Prologue, Knight's Tale, &c.* (Clarendon Press, 1875).

In the oldest English there were several plural endings, *-as, -an, -n, -a, -o.* After the Norman Conquest these were reduced (1) to *-es, -en, -e;* (2) to *-es, -en;* and finally the suffix *-es* or *-s* became the ordinary plural ending.

Thus *-as* was originally only the plural sign of one declension of masculine nouns, as, *fisc*, fish, pl. *fiscas.** *-s* is added (1) to nouns terminating in a liquid or dental, as *palmers, pilgrims, naciouns*, &c.; (2) to short words of one syllable.

Some few nouns (originally forming the plural in *-an*) have *-en, -n*, as *asschen* (= ashes), *assen* (= asses), *eyen, yen* (= eyes), *fleen* (= fleas), &c.

Brethren, daughtren, sistren (or *sustren*), *children, fon, foen* (= foes) also occur.

Deer, folk, good, hors, treet, scheep, sum, thing, yer, yeer, are unchanged in the plural.

2. The genitive case singular ends in *-es*, as:

Ful worthi was he in his *lordës* werre. *Prol.*, 47.

3. The dative case singular occasionally occurs and terminates in *-e*, as *beddë, holtë*, &c.

4. The genitive plural is much the same as in Modern English: as, *foxës* tales, *mennës* wittes, &c.

In Chaucer's time, and even later, we find (1) an inflectional *-e* to mark the plural number; (2) an inflexional *e* for the definite adjective—that is, when preceded by a demonstrative pronoun or a possessive pronoun, as:

Whan Zephirus eek with his *sweetë* breethe
Enspired hath in every holte and heethe
The tendrë croppes, and the *yongë* sonne
Hath in the Ram his *halfë* cours ironne. *Prol.*, 5–9.

II. *Adjectives.*—As in Modern German adjectives have two forms—*definite* and *indefinite*. The *definite* form preceded by the definite article, a demonstrative adjective, or a possessive pronoun, terminates in *-e* in all cases of the singular, as "The *yongë* sonne," "his *halfë* cours," &c. Words of more than one syllable nearly always omit the final *-e*. The vocative case of the adjective takes this *-e;* as "*Leevë* mother," and "*strongë* God," &c. The comparative degree is formed by adding *-er* (*-re*) to the positive; and the superlative degree terminates in *-este* (*-est*): *nest* (or *next*), and *hext* (= highest) are abbreviated forms. The plural of adjectives is denoted by a final *-e*, as:

And *smalë* fowles maken melodie. *Prol.*, 9.

Chaucer has instances of the Norman-French plural *-s* in such phrases as *cosins germains, places delitables.*

In Middle English the adjective of Romance origin frequently took a plural termination (*-es, -s*) when placed after its substantive.

III. The old plural of the definite article *tho* (A.S. *tha*) is still used, but the uninflected *the* is more common. Chaucer never uses *that*, except as a demonstrative adjective, as in the present stage of the language. The pronouns are:

Sing.	*Plur.*	*Sing.*	*Plur.*
Nom. *I, ich, ik.*	*We.*	*Thou, thow.*	*Ye.*
Gen. *Min* (*myn*) *mi* (*my*).	*Our, oure.*	*Thin* (*thyn*), *thi* (*thy*).	*Your, youre.*
Dat. & Acc. *Me.*	*Us.*	*The, thee.*	*Yow, you.*

	Sing.		*Pl.*
Nom. *He.*	*She.*	*Hit, it.*	*Thei, they*
Gen. *His.*	*Hire, hir.*	*His.*	*Here* (*here, hir*).
Dat. & Acc. *Him.*	*Hir, hire, here.*	*Hit, it.*	*Hem.*

IV. *Verbs.*—1. The indicative mood is thus inflected—

Present.			*Past.*		
I *lovë.*	We	*lov-en, lov-ë*	I *lov-ede*	We	*lov-eden, lov-ede.*
Thou *lov-est.*	Ye		Thou *lov-edest.*	Ye	
He *lov-eth.*	They		He *lov-ede.*	They	

2. The infinitive mood ends in *-en* or *-e, speken, speke.* The *-n* was dropped at an early period, in the Southern English dialect of the fourteenth century, and *-e* is preferred to *-en.*

V. *Participles.*—1. The present participle usually ends in *-yng.* The A.S. suffix *-ende* is used by Gower; but in the Southern dialect of Early English we find *-inde* (Northern *-ande, -and.* East Midland *-end, -and*), which has evidently given rise to *-inge*, of which *-yng* is a shorter form.

* When *-as* became *-es*, it still remained, for the most part, a distinct syllable, as in the above passage from Chaucer. Traces of this form we have in Elizabethan writers:

Then looking upward to the heaven's beams,
With *nightës* stars thick powder'd everywhere. *Sackville: Induction.*
To show his teeth as white as *whalës* bone. *Shakesp.: Love's Labour's Lost*, v. 2.

2. The past participle of weak verbs terminates in *-ed, -d,* and occasionally in *-et, -t;* those of strong verbs in *-en, -e.* The prefix *y-* or *i-* (A.-S. *ge-*) occurs frequently before the past participle, as *ironne* (= run), *ifalle* (= fallen).

Under the guiding influence of Chaucer the language of England at once advanced to that preëminence which it maintains among the languages of Europe. Its vocabulary, hitherto unregulated and fluctuating, was now reduced to order; one form of speech constituted the standard of literary composition, and the age of English literature had fairly begun. Chaucer, in his poems, entirely discarded alliteration, the chief metrical characteristic of the Anglo-Saxon and English poems written before his time, and adopted rime,* and by his influence riming verse was firmly established as an essential element in our poetry. In the North and West of England alliteration was employed as late as the end of the fifteenth century. The *Canterbury Tales* are, for the most part, written in heroic couplets, or lines containing five accents. In this metre we have ten syllables, but we often find eleven, and occasionally nine. Final *-es* is a distinct syllable in the genitive singular and the plurals of nouns, and also in adverbs.

The *-ed* of past participles is generally sounded.
In the past tense of weak verbs ending in *-de* or *-te*, the final *e* is sounded.
Final *e* is generally sounded, except in the personal pronouns, in many words of more than one syllable, and in words of Romance origin.

The pronunciation of Anglo-Saxon probably resembled that of Latin, placing the stress of the voice (or accent) upon the root, and not upon the inflected syllables.

"The vocabulary of the French language is derived, to a great extent, from Latin words deprived of their terminal inflections. The French adjectives *mortal* and *fatal* are formed from the Latin *mortalis* and *fatalis*, by dropping the inflected syllable; the French nouns *nation* and *condition*, from the Latin [accusatives *nationem, conditionem*] by rejecting the *em* final. In most cases the last syllable retained in the French derivatives was prosodically long in the Latin original; and either because it was also accented or because the slight accent which is perceivable in the French articulation represents temporal length, the stress of the voice was laid on the *final* syllable of all these words. When we borrowed such words from the French, we took them with their native accentuation; and as accent is much stronger in English than in French, the *final* syllable was doubtless more forcibly enunciated in the former than in the latter language." †

The French accentuation even affected pure English words. Thus we find *wisli'che* for *wi'sliche, begynnyng, endyng*, &c., and Chaucer rhymes *gladnes'se* with *distres'se*. As pronounced in Chaucer's time, the letters had probably the following values: $a = ah$, as in *father;* $c = k$ before *a, o, u*, or any consonant, and $= s$ before *e, i*, or *y;* *e* (long) as *e* in *there;* *e* (short) as in German *gutë;* *g*, hard in all *non-French* words, and $= j$ before *e* or *i* in words of French origin; *i* (long) = the lengthened sound of *i* in *still;* *i* (short), as in *pin;* *ɛ* was never = *sh* or *zh* as at present; *sch* = *sh* in *shall;* *u* (long) had the sound of French *u;* *u* (short) German *ü;* *y* (vowel) had the same sound as *i;* *y* (consonant) as at present.

From Chaucer's *Pardoner's Tale* (written c. 1390):

Now for the love of Crist þat for us dyde,
Levith ȝoure othis, boþe gret and smale.
But, sires, now wol I telle forþ my tale.
These riottoures þre, of which I ȝou telle,
Longe erst þan prime rong of eny belle,
Were set hem in a tavern for to drynke;
And as þey sat[te], þay herd a belle clinke
Biforn a corps, was caried to þe grave;
That oon of hem gan calle unto his knave,
"Go bet," quoþ he, "and axe redily,
What corps is þat, [þat] passes her forþby;
And loke þou report his name wel."

* There are a few lines on the death of William the Conqueror in the *A.S. Chronicle* written in rime Robert of Gloucester, Robert de Brunne, Hampole, and others, also wrote in rime.

† *Marsh: Lectures on the English Language*, lect. v.

Chaucer was closely followed by his friend John Gower, of whom he speaks as the "Moral Gower." Gower was born in 1325, was a student of Merton College, Oxford, and died in 1408. In his youth he wrote in French (*Speculum Meditantis*) and in Latin (*Vox Clamantis*), but when old he wrote in English, differing little from that of Robert de Brunne, his *Confessio Amantis.** His fame rests principally upon the accuracy and precision of his rhyme and vocabulary, which contributed greatly to determine the form of the language. In literary merit he was far inferior to his great contemporary, Chaucer. In his grammar he closely resembles him, except that he clips the prefix *-y* or *-i* to the past participle, and tries to keep alive the present participial ending *-and*, Chaucer preferring the corrupt ending *-ing*, first seen in Layamon. The *Confessio Amantis*, from which the following extract is taken, was written in 1393.

Thei knelen alle, and wiþ o vois,
The king þei þonken of þis chois;
And after þat þei up arise
And gon aside and hem avise;
And ate laste þei acorde
(Wherof her tale to recorde
To what issue þei be falle).
A knyht schal speke for hem alle.
He kneleþ doun unto þe king
And seiþ þat þei upon þis þing,
Or for to winne or for to lese,
Ben alle avised for to chese.†

During the first three-quarters of the fifteenth century English Literature declined: the original and creative power of the English mind seems to have disappeared, and much of the literature of this period consists of mere translations or imitations of older models. The names of some seventy poets have come down to us as having written during this dreary period; of these the best known and the most deserving of commendation are Occleve, Lydgate, James I. of Scotland, and Harry the Minstrel. The prose-writers during this period are few in number, and are principally theological. The most notable are Bishop Pecock (1395–1460), author of *The Repressor of over much Blaming of the Clergy*, written about 1449, and Sir Thomas Malory, compiler of *La Morte Darthur*, 1469–70. John Lydgate (1373–1460) was ordained a sub-deacon in the Benedictine Monastery of Bury St. Edmunds in 1389, deacon in 1393, and priest in 1397. He is the author of several poems—*The Storie of Thebes, The Falls of Princes* (from Boccaccio), and *The Troy Book*—besides numerous minor works. He is remarkable for the great ease and fluency of his language. The following extract from his *London Lickpeny* is printed here from the Harl. MS. 367:

To London once my stepp[e]s I bent,
  Where trouth in no wyse should be faynt,
To-westmynster-ward I forthwith went,
  To a man of law to make complaynt;
  I sayd, "for marys love, that holy saynt!
Pyty the poore that wolde proceede;"
But for lack of mony I cold not spede.

And as I thrust the prese amonge,
  By froward chaunce my hood was gone,
Yet for all that I stayd not longe,
  Tyll to the kynges bench I was come.
  Before the Judge I kneled anon,
And prayd hym for god's sake to take heede;
But for lack of mony I myghte not speede.

From Bishop Pecock's *Repressor*, pt. i., ch. xix.‡

Also, þou schalt not fynde expresseli in holi scripture þat þe newe testament schulde be write in englisch tunge to lay-men, or in latyn tunge to clerkis; neiþer þat þe oold testament schulde be write in englisch tunge to lay-men, or in latyn tunge to clerkis; and yit ech of þese gouernauncies þou wolte holde to be leeful, and to be a meritorie vertuose moral deede for to þerbi deserue grace and glorie, and to be þe seruice of god, and þerfore to be þe lawe of god; siþen bi no deede a man haþ merit, saue bi a deede which is þe seruice and þe lawe of god; and ech moral vertu is þe lawe of god, as it is proued weel in oþere place of my writingis.

As a specimen of the Norfolk dialect of the middle of the fifteenth century, we give here a letter written by Sir John Fastolf to Sir Thomas Howys and William Barber:*

To my ryght trusty freende, Sir Thomas Howys, Parson of Castillcombe, beyng at Castre, and William Barber, in haste, at Castre In, by Yermuth [Yarmouth].

Ryght trusty and wellbelovyd freende,—I grete you well. In 1477 the art of Printing was introduced into England by William Caxton (1422 – 1491), who established his press in the almonry of Westminster Abbey. This art at first acted as a disturbing element upon the language, and tended to augment the existing disorder, but in the end it essentially promoted orthoëpical and orthographical consistency, uniformity of speech, and elegance in literary composition.

Caxton had passed many years of his life abroad, and the early productions of his press were, for the most part, translations from the French. As a consequence, his style is pervaded by Gallicisms, both in vocabulary and in structure, and a very large number of French words and idioms was introduced by him. Moreover, Caxton (as indeed every printer), having no uniform standard of orthography, reduced the orthography of the authors printed by him to an arbitrary standard of his own devising, and thus the sanction of authority being given to numerous anomalies and diversities of spelling, considerable confusion and discrepancy resulted. But though at first the cause of this confusion, the art of printing, when once its real character and importance were clearly apprehended, exercised the most potent effect upon our tongue by dispelling the prevailing rudeness, by facilitating elegance and harmony of style, and by promoting uniformity and regularity of speech. The multiplication of books and readers tended to assimilate the various dialects to the Southern, or the speech of the capital and of the southern counties, and the dialect of books superseded local forms and provincial usages, except amongst the uneducated classes.

In Caxton's first work we see the loss of the old Southern inflections of the verb; and we find Ormin's *their*, *them*, and *that* (*iste*) well established, instead of the Southern *her*, *hem*, and *thilk* employed by Pecock. Plural adjectives no longer end in *-s:* thus we have *strange habitacions* in the first page of the *Recuyell of the Historyes of Troye*. The old form *that oon . . . that other* (in Latin *alter . . . alter*) comes once more. In the *Game of the Chesse*, published in 1474, we find *ner* for the Latin *neque*, an odd mixture of the Southern *ne* with the North-Western corruption *nor*. The hard *g* is seen once more, as in *agayn*, driving out the usurper *y*. †

There are upwards of twenty-two folio volumes printed by Caxton, which he had himself translated from French, Dutch, or Latin originals. Between 1523 and 1525 Lord Berners (1464 1532) translated Froissart's *Chronicles*. Of this work Mr. Marsh says: "This translation is doubtless the best English prose style which had yet appeared, and, as a specimen

of picturesque narrative, it is excelled by no production of later periods."* The extract is from the description of the Battle of Creçy, ch. cxxx.:

Also the same season there fell a great rayne and a clyps, with a terryble thunder; and before the rayne, there came fleying ouer to the batayls a great nombre of crowes, for feare of the tempest commynge. Than anone the eyre begaune to waxe clere, and the sonne to shyne fayre and bright: this which was right in the frenchmens eyen, and in the englysshmens backes. Whan the genoways were assembled toguyder and beganne to aproche, they made a great leape and crye to abasshe thenglysshmen, but they stode styll and styrrde nat for all that.

The next important production of this era—one which has exerted a more decided influence upon the English tongue than any other native work between the eras of Chaucer and Shakespeare—is William Tyndale's *Translation of the New Testament*, first printed in 1525. Tyndale was born[‖] about 1477, and was burnt for heresy at Antwerp in October, 1536. His translation of the New Testament is one of the finest works in our language, and the present Authorised Version owes very much to it. We give here his translation of Matthew v. 16–19:

16. Se that youre light so shyne before men, that they maye see youre good workes, and glorify youre father which is in heven.

17. Ye shall not thynke that I am come to disanull the lawe, or the prophets; no I am nott come to disannull them, but to fulfyll them.

18. For truely I say vnto you, till heven and erth perisshe, one iott, or one tytle, shall not scape tyll all be fulfilled.

19. Whosoever breaketh one of these lest comaundementes, and shall teache men so, he shalbe called the leest in the kyngdome off heven; but whosoever shall observe, and teache them, that persone shalbe called greate in the kyngdome of heven.

Tyndale's great opponent, Sir Thomas More, was born in London in 1480; educated at Oxford, appointed Lord Chancellor October 25, 1529, and beheaded, on a charge of high treason, July 6, 1535. His most famous work was his *Utopia*, written in Latin, and printed in 1516. In the following extract† he charges Tyndale with not observing aright the distinction between *no* and *nay;* but, curiously enough, he misstates his own rule.

I woulde not here note by the way, that Tyndal here translateth *no* for *nay*, for it is but a trifle and mistaking of the englishe worde: sauing that ye shoulde see that he whych in two so plain englishe wordes, and so commen as is *naye* and *no*, can not tell when he should take the tone, and when the tother, is not for translating into englishe, a man very mete. For the vse of those two wordes in aunswerring to a question is this, *No*‡ aunswereth the question framed by the affirmatiue. As for ensample, if a manne should aske Tindall hymselfe: "ys an heretike mete to translate holy scripture into englishe?" Lo, to thys question, if he will aunswere trew englishe, he muste aunswere *nay* and not *no*. But and if this question be asked hym thus, lo: "Is not an heretyque mete to translate holy scripture into english?" To this question, lo, if he wil aunswer true english, he must aunswere *no* and not *nay*. And a lyke difference is there betweene these two adverbes, *ye* and *yes*. For if the questeion bee framed vnto Tindall by thaffirmatiue in thys fashion: "If an heretique falsely translate the newe testament into englishe, to make hys false heresyes seeme the worde of Godde, be hys bookes worthy to be burned?" To this question asked in thys wyse, yff he wil aunswere true englishe, he must aunswere *ye* and not *yes*. But nowe if the question be asked hym thus, lo, by the negatiue: "If an heretike falsely translate the newe testament in-to englishe, to make hys false heresyes seme the word of God, be not his bokes well worthy to be burned?" To thys question in thys fashion framed, if he wyll aunswere trew englyshe, he maye not aunswere *ye*, but he must aunswere *yes*, and say, "Yes, mary, be they, bothe the translacion and the translatour, and al that wyll holde wyth them."

Sir Thomas Wiat (or Wyatt),§ called the Elder, to distinguish him from his son, was born in 1503, and died in 1542. In his songs he imitated Surrey, but he is chiefly remarkable as being the first writer of English Satires, of which three have been preserved.

The next author from whom we quote is Hugh Latimer, Bishop of Worcester. He was born in Leicestershire in 1491, and was burnt with Bishop Ridley at Oxford, October 16, 1555. His sermons were very popular, the most notable of all being that known as the *Sermon on the Ploughers*, preached at St. Paul's, January 18, 1548–9.*

> And wel may the preacher and the ploughman be ykened together. Fyrste for their labour of all ceasons of the yere. For there is no tyme of the yere, in whiche the ploughman hath not some speciall worke to do, as in my countrey in Leicestre Shire, the ploughe man hath a tyme to set furth and to affaie hys plough, and other tymes for other necessarie workes to be done. And then they also maye be likenede together, for the diuersitie of workes and varietie of offices yat they haue to do. For as the ploughman firste setteth furth hys plough and then tilleth hys lande and breaketh it in furroughes, and sometime ridgeth it vp agayne. And at an other tyme harroweth it, and clotteth it, and sometyme doungeth it, and hedgeth it, diggeth it, and weedeth it, pourgeth and maketh it cleane. So the prelate, the preacher hath mani diuers offices to do.

Nicholas Udall was born in Hampshire about 1504, and died at Westminster in 1556, having been master of Westminster School in that and the preceding year. He published a translation of the third and fourth books of the *Apophthegms* of Erasmus, and also assisted in translating Erasmus' *Paraphrase of the New Testament*, but he is chiefly noted for his comedy of *Roister Doister*, the earliest English play extant, written before 1553. It is divided into acts and scenes, and is a fair specimen of comedy.

Thomas Sackville, first Lord Buckhurst and Earl of Dorset (1536–1608), is best known as the author of the tragedy of *Gorboduc*, otherwise called *Ferrex and Porrex*. He also planned *The Mirrour for Magistrates*, a collection of narratives by several poets on the misfortunes of the great men in English history, and contributed to it "The Induction," or poetical preface, and "The Complaint of the Duke of Buckingham."

In 1545 appeared the *Toxophilus* of Roger Ascham (1515–1568), tutor to Queen Elizabeth, and Latin Secretary to Edward VI., Mary, and Elizabeth, successively. His greatest work is *The Schoolmaster*, published posthumously by his widow in 1570, and again in 1571.

The chief and best work of George Gascoigne (1525–1577) is the *Steel Glas*, written in 1576. The *Steel Glas* is, in fact, a mirror, in which the poet sees a reflection of various estates of men, whom he describes with severe exactness and some fine satirical touches.

In Spenser's (c. 1550–1598) *Faery Queene*, we seem to be transported back to archaic times. He had an affinity for those olden turns of expression, those inflections, which were dying out, and which give the *Faery Queene* at first sight the appearance of having been written in an obsolete dialect. Without any intention of writing in obsolete English, he looked always backwards, never forwards, in his choice of words and phrases. But his use of archaisms degenerated into affectation, so that even men of his own age thought his style too antique. Daniel† says of him:

> "Let other men sing of knights and palladines
> In aged accents and untimely words."

He reverted to the old system of alliteration, of which he seems to have been particularly fond. His stanza is said to be a modification of the *ottava rima* of Ariosto. To illustrate the archaisms of the *Faery Queene*, the following examples will suffice:

In constructions, the impersonal verb is used without the usual pronoun before it: *sits not* = "it sits not," *seemed* = "it seemed," and the like, occur very frequently: or again, the use of the double negative, *ne can no man*: or *should* for "would have" as *should beare* for "would have borne." As to forms or inflexions, we may notice among parts of verbs the past participle *ydrad*=dreaded,

* From *Arber's Reprints*, 1868, p. 19. † Sonnet cxi.

ycladd = clad, *troden* = trodden, *woxen*, past participle of "to wax;" the preterite *lad* = led; *wot*, preterite of "to weet;" *raft* of "to reave" = to bereave; *can* = gan = began; *raught* = reached; *brast* = burst. Again, we find *bene, been*, for the modern "are;" *mote* = might; and a variety of similar forms. *Trenchand, glitterand*, are present participles. There are also old plurals of nouns, as *foen* = foes, *eyne* or *eyen* = eyes.*

The *Faery Queene* affords instances of a large number of words in process of transition or assimilation from the French into our own tongue. Thus in the edition of 1590 occurs *ferse*, in 1596 *fierce; perse, persaunt* are nearer the French origin than *pierce, piercing; richesse, noblesse, humblesse*, are words not yet digested by our language; *renverst, esloyne, covetise, pourtrahed, journal* (for "daily"), are all French forms; *insúpportable, envý, spirituall, the tigré cruél*, are all in pronunciation nearer the French than the English.

There are also numerous Latinisms and imitations from the Italian throughout the poem. Spenser's other poetical works are *The Shepheard's Calender* (1579), *Astrophel* (1586), *Colin Clout's Come Home Again* (1592), *Mother Hubbard's Tale* (1590), *Epithalamium* (1594), &c.; and in prose the *View of the Present State of Ireland* (1598).

Behold I see the haven nigh at hand,
To which I meane my wearie course to bend;
Vere the maine shete, and beare up with the land,
The which afore is fairely to be kend,
And seemeth safe from storms, that may offend:
There this faire virgin wearie of her way
Must landed be, now at her journeyes end:
There eke my feeble barke a while may stay,
Till merry wind and weather call her thence away.
Faery Queene, I. xii. 1.

With the above quotation this sketch of the English Language naturally closes. After some five centuries of struggle and vicissitude a standard literary language had at last been formed. Ever growing, ever spreading, taking in its vocabulary words from every source changing, though almost imperceptibly, the English Language, with its magnificent store of literature, has become the language of hundreds of millions. And yet it is comparatively neglected; only of late years has the attention which it deserves been paid to it. English has been passed over, and been considered useless or undeserving of being taught in our schools, while all attention has been given to the Classical Languages.

"It is quite certain" (says Professor Skeat) "that the reason why the study of Anglo-Saxon is so strangely neglected among us is simply that it has never had a trial, nor has ever had even the chance of a trial. The most extraordinary misconception concerning it, and even prejudices against it, are so widely prevalent that we cannot wonder at the tendency to set aside and ignore it. Hence the curious result that, while it does not flourish in its native home, we find German periodicals in existence which are mainly devoted to it, while I am informed that in America the students of Anglo-Saxon are to be counted, not as here by tens, but by hundreds. Whilst we English are proud of our country, of our history, of our conquests, of our empire, we have for centuries looked down upon the main stock of our own noble language as if that, at any rate, is insignificant. Or, if we acknowledge the beauty and force of our language, we are seldom led on duly to consider its history. A moment's reflection will tell us that the historical method of study is the only rational one; and yet we are accustomed—which is the strangest thing of all—to treat one part of our language historically, and not the other. If a word come to us from the Latin or Greek we are expected, as scholars, to explain it; but as to the words that come to us from the Anglo-Saxon or the Old French, it is usual to treat them as being either, on the one hand, beneath notice, or as being, on the other hand, inscrutable. The fault lies simply in the establishment of a customary and short-sighted prejudice that has shut out English from its proper place in the school-boy's course of study. Boys are taught how to use Latin and Greek dictionaries, but they are not allowed to see an Anglo-Saxon dictionary; nor, if they saw one, could they find their place in it without help. To learn all the letters of the Greek alphabet comes to most boys as a matter of course; but to learn the three or four so-called Anglo-Saxon letters which present a trifling difficulty by their unusual forms, is often regarded as involving some severe effort."†

ENGLISH LEXICOGRAPHY.

The first English-Latin Dictionary was the *Promptorium Parvulorum sive Clericorum*, compiled by Geoffrey, a Norfolk grammarian. It exists in several manuscripts, dating from about the year 1440. It was printed by Pynson in 1499, by Julian Notary in 1508, and by Wynkyn de Worde in 1510, 1512, 1516, and 1528. In 1843 the first part was reprinted by the Camden Society, under the editorship of the late Mr. Albert Way, a scholar peculiarly fitted for the task. The work, extending to 563 pages, was not completed till 1865. In it references are made to several existing glossaries, some of which have been identified, notably the *Dictionarius* of John De Garlandia.* The earliest Latin-English Dictionary known is that entitled *Medulla Grammatice* (or *Grammatices*), which, in the opinion of Mr. Way, was probably compiled by the author of the *Promptorium*. The earliest MS. known of this work dates about 1460, but there are several later copies.† The *Ortus Vocabulorum*, based in a great measure on the *Medulla*, was the first Latin-English Dictionary printed in this country, the first edition being from the press of Wynkyn de Worde in 1500, and other editions appearing in 1508, 1509, 1511, 1514, 1516, 1518, 1528, 1532, 1533, and 1539.‡ These numerous editions testify to the popularity of the work. After the *Promptorium Parvulorum*, the next English-Latin Dictionary is the *Catholicon Anglicum*, a work specially valuable as being the first dated dictionary. From the colophon we learn that it was compiled, or rather completed, in 1483. It exists only in two MSS.: the earlier (add. MS. 15562), assigned by the authorities of the British Museum to about 1475, which is imperfect, and the later, dated, as said above, 1483, which is perfect. From this later copy the MS. was edited, with notes and annotations, for the Camden and Early English Text Societies in 1881, some four hundred years after its compilation.

The next most noticeable Dictionary is Palsgrave's *Lesclaircissement de la Langue Francoyse*, printed in 1530, a work of incalculable value, written in English-French, and reprinted in 1852.

The *Vulgaria* of William Horman, Head-Master and Vice-Provost of Eton (died 1535), was printed for the first time by Pynson in 1519,§ in small quarto, and reprinted for the first and last time by Wynkyn de Worde in 1530.‖ It is a valuable and interesting work, full of quaint sentences and phrases in English-Latin.

Wyllyam Salesbury's *Dictionarie in Englysche and Welshe* appeared in 1547

The *Abecedarium Anglico-Latinum pro Tyrunculis* of Richard Huloet appeared in 1552, and a new edition, greatly enlarged, with the addition of the French and many phrases, chiefly from Thierry's *French and Latin Dictionary*, was published by John Higgins, and printed by Thomas Marsh in 1572. It is dedicated to Sir George Peckam. Huloet was the first to adopt the true method of forming a trustworthy Dictionary. He

writes: "For the better attayning of the knowledge of words I went not to the common Dictionaries only, but also to the authors themselves . . . and finally, I wrote not in the whole booke one quyre without perusing and conference of many authors."

Next in order comes J. Withal's *Shorte Dictionarie in Latin and English verie profitable for yong Beginners*, a title changed in later editions to *A Dictionary in English and Latine: Devised for the capacitie of Children and young Beginners.* It is rather a vocabulary than a dictionary. The first edition, undated, has as its colophon: "Imprinted by the late house of William Caxton" by Wynkyn de Worde. This work was very popular, and was reprinted in 1554, 1559, 1567, 1572, 1594, 1599, and 1634. The running title is *A little Dictionarie for Children.* In the edition of 1634 is mentioned "A greene or grassy banke, that they call by London, Primrose hill."

In 1570 appeared the English-Latin Dictionary of Peter Levins (or Levens), known as *Manipulus Vocabulorum, A Dictionarie of English and Latin wordes set forthe in suche order as none heretofore hath ben . . . necessary not onely for Schollers that want variety of Words, but also for such as use to write in English meetre.** This work is noticeable as being the first riming Dictionary.

In 1573 John Baret published his *Alvearie*, written in English, Latin, French, and Greek, the last being at times omitted for the simple reason given by Baret himself: "As for Greeke, I coulde not ioyne it with every Latin word, for lacke of fit Greeke letters, the printer not having leasure to provide the same."

John Florio, teacher of French and Italian at Oxford, and afterwards tutor to Prince Henry, son of James I., published in 1598 his Italian-English Dictionary, to which an English-Italian part was added by Giovanni Torriano, a fellow-teacher; and in 1611 Randle Cotgrave printed his *English and French Dictionary*, or *Bundle of Words*, as he terms it in his preface. It is a most valuable work to the students of obsolete language. In 1632 it received the desirable addition of an English-French Dictionary by Robert Sherwood A French grammar is appended.

John Bullokar's diminutive Dictionary of "hard" words appeared in 1616, and is noticeable as being the first Dictionary in which the English words are explained by English It was followed in 1617 (in its full form, the first edition having appeared in 1599) by John Minsheu's folio, the title of which is in Latin and English, the latter reading, *The Guide into the Tongues*, and which professes to give the "agreement and consent one with another, as also their Etymologies, that is, the Reasons and Derivations of all or the most part of words in these nine Languages, viz.:

1. English,	4. French,	7. Latine,
2. Low Dutch,	5. Italian,	8. Greeke,
3. High Dutch,	6. Spanish,	9. Hebrew, &c."

In the original edition the Spanish is placed first, in later editions the English.

Henry Cockeram published his Dictionary in 1623. It is a small volume, by which he hoped to teach "Ladies and Gentlewomen, young schollers, clarkes, merchants, as also strangers of any nation," who were desirous of "a refined and elegant speech" to take his work as an "Alphabeticall and English Expositor" of "vulgar words," "mocke words," "fustian termes . . . ridiculously used in our language," so that by looking into his Expositor they might "receive the exact and ample word to expresse" their meaning.

* Reprinted for the Early English Text Society in 1867, under the editorship of Mr. Henry B. Wheatley.

Accordingly, he tells us that *rude* is vulgar, and *agresticall* the proper word to be used for it, or *rusticall, immorigerous, rurall*; also, that *to weede* is vulgar, and the choice word *to sarculate, to diruncinate, to averuncate.*

In 1656 Thomas Blount published his little octavo Dictionary entitled *Glossographia*, written, as he says, "for all such as desire to understand what they read," and so save them from being, as he was, "often gravell'd" by hard words. Two years later Edward Phillips, nephew of Milton, published his folio *New World of Words, or, a General English Dictionary . . . A Work very necessary for Strangers, as well as our own Countrymen, or for all persons that would rightly understand what they discourse, write, or read.* This work is little else than a copy of Blount's *Glossographia*, blunders and all, with many blunders added, and is therefore of little use to the student. A third edition of it was published in 1671, and a fourth in 1678. Kersey added some 20,000 words to it in 1706. The blunders in it were mercilessly shown up by Blount in his *World of Errors discovered in the New World of Words, &c.*, 1673.

An anonymous Dictionary, entitled *Glossographia Anglicana Nova*, appeared in 1707. The bulky folio of Dr. Stephen Skinner was published in 1671, containing elaborate explanations of English words in Latin. It is especially noticeable for the number of fictitious Anglo-Saxon words which he invented to stand as etymologies for English words. It, in company with the *Etymologicon Anglicanum* of Junius, was used by Dr. Johnson for his etymologies.

Nathan Bailey's *Universal Etymological English Dictionary* first appeared in 1721. His work, originally in octavo, with woodcuts, was reprinted time after time, both in octavo and folio, with and without woodcuts. It contained words current as well as obsolete, easy as well as hard, scientific and dialectic. A folio copy, interleaved, was the foundation of Dr. Johnson's famous Dictionary. Bailey's etymologies are mostly taken from Minsheu and Spelman. *To jeopard* he derives from the French *j'ai perdu* = I have lost all. A *guest* he defines as "a person invited to, or received at a feast; a stranger who lodges with one the second night" The work is interspersed with proverbs, as: "*As sure as God's in Gloucestershire.* This proverb is said to have its rise, on account that there are more rich and mitred abbeys in that, than in any two shires in *England* besides; but some, from *William* of *Malmesbury*, refer it to the fruitfulness of it in religion, in that it is said to have returned the seed of the Gospel with the increase of an hundredfold." Bailey's work remained the standard for thirty years.

Passing over Kersey, Dyche, Defoe, Sparrow, Pardon, and Martin, we come to the well-known name of John Wesley, whose *Complete English Dictionary* was published first in 1753, and again in 1764 and 1765. In his preface "to the Reader" he writes: "Many are the mistakes in all the other English dictionaries which I have seen. Whereas I can truly say, I yet know of none in this; and I conceive the reader will believe me, for if I had, I should not have left it there. Use then this help, till you find a better.' Some of his definitions are not very clear or simple: as, for instance, "An *abscess*, an imposthume;" "An *ortolan*, a very dear bird." Others are interesting: as, "The *Elect*, all that truly believe in Christ;" "A *Puritan*, an old strict Church of England man;" "*Quietists*, who place all religion in waiting quietly on God;" "A *Methodist*, one that lives according to the Method of the Bible."

Next comes the great folio Dictionary of Dr. Samuel Johnson, which is too well-known to require much comment here. It appeared first in 1755, and was a laborious undertaking. Johnson's task was far more difficult than that of any of his numerous successors. The

vocabularies ready to his hand were so meagre, that he had to raise his stupendous pile almost from the foundation. His great work has formed the foundation and starting-point of all his successors, whose task has to a great extent been to modify and add to his central pile to suit modern conditions. The folios are exceedingly valuable for their wealth of quotations. An American reviewer says:

"It has been often said, and truly enough, that the merits of Johnson's dictionary have been overrated. The merits of that which is best in its department will always be popularly overrated; and Johnson's dictionary certainly does not possess the uniform excellence which has sometimes been ascribed to it. But that work was not only for a long period relatively the best of its kind, it was, absolutely, a production of wonderful ability, and there are, in the whole range of modern literature, few achievements of a single intellect which exhibit such conclusive evidence of great learning, great genius, sound judgment and conscientious industry. . . . When we consider the state and tendencies of the language in his time, the little sound learning that then existed respecting the true character and early history of the English tongue, and the other unfavorable circumstances under which his task was performed, it seems truly surprising that he should have accomplished so much; and we may say that though the merits of the dictionary may have been overrated, those of the lexicographer hardly can be."

It might be well to end our review of the progress of English Lexicography at this point, since the Dictionaries which followed Johnson were either revised editions of his, or were based on his as their model. They are of every degree of merit and demerit; some—like that of Dr. Ash (1775)—principally notable for their errors; some, great improvements upon their exemplar. Of those of English origin, the most important are Todd's revised edition of Johnson, and Richardson's Dictionary, the latter valuable as a storehouse of quotations. Of American Dictionaries, it will suffice to name the monumental works of Webster and Worcester, whose characteristics are too well known to need any remarks here concerning them.

The recent and most prolific idea in Dictionary making is to obtain the collaboration of a considerable number of specialists, each an authority in the field of work committed to his care. Of the Dictionaries produced in this manner may be named the Century and the Standard, of American origin, and Murray's and the Encyclopædic Dictionary, of English origin; the last named being particularly valuable from the vast amount of encyclopædic information which it adds to its fullness as a Dictionary of English speech.

Mention should be made here of Prof. Skeat's *Etymological Dictionary of the English Language*, a work of the highest value, and which has been freely used in the preparation of the present work. In conclusion it may be said, that within the present century the Dictionaries of the English language have been supplemented with a large number of glossaries of words, phrases, slang terms, dialects, rhyming words, and synonyms, and Dictionaries of Theology, Law, Medicine, Science, &c., the whole forming a sum of verbal information of extraordinary completeness and value.

SCRIPTURE AND CLASSICAL PROPER NAMES.

ON THE PRONUNCIATION OF SCRIPTURE AND CLASSICAL PROPER NAMES.

WITH SOME GENERAL DIRECTIONS FOR THE PRONUNCIATION OF GREEK AND LATIN.

THE plan adopted in printing these lists has been (1) to divide the proper names into syllables by the usual hyphen sign (-); and (2) to mark the accent (′). The only diacritical mark employed in the List of Proper Names is the macrotone (¯). In the list of quotations the Greek is printed in its proper type, the English transliterations being added within parentheses, as in the body of the work. In the Latin quotations vowels long by nature are so marked (ē), except in the cases where their position would show them to be long [p. 5310]; and contractions are indicated by a circumflex accent (ˆ), as *virûm*, for *virōrum*.

I. SCRIPTURE NAMES.

The names in this list are chiefly from the Hebrew, some from the Greek, and a few from the Latin. The pronunciation of Hebrew is a question of great uncertainty, and even among the Jews who use dialectal forms of it two schools of pronunciation exist—the German and the Spanish. In England and America the ordinary value is given to the letters, except to *g*, which is hard, as in Gilead, Gilgal, Bethphage being the sole instance in which it has the sound of English *j*; so that if the long vowel mark (if any) and the position of the accent be duly noted there can be no difficulty as to the pronunciation of any of these words. Thus, in *Ā′-bel Mā′-im*, the hyphen shows the division into syllables, the macrotone (¯) marks the long vowels, and the omission of any diacritical mark over *e* and *i* shows that these letters have their ordinary English value.

II. GREEK.

It is well-nigh impossible for us in the nineteenth century to determine with any certainty the original pronunciation of Greek words and names. We have neither trustworthy record nor unbroken tradition to help us. The study of Greek fell into disrepute with the decline of the Roman Empire, and, indeed, was not revived in Europe until the fifteenth century. At that time a perfectly arbitrary value was assigned to each letter in the Greek alphabet. At the beginning of the sixteenth century Greek pronunciation had assumed a curious phase. Only two sounds were given to all the Greek vowels and diphthongs, whether long or short; *υ* was pronounced as *v* and *κ* as *ch*, so that *κενταύροις* was pronounced *chentafris*. About 1540 a reaction took place against this method, and after a struggle the principle of pronouncing Greek as though it were English was accepted. For us the question of Greek pronunciation is further complicated by the fact that the Greek alphabet differs entirely from the Roman, which has generally been adopted in the modern languages of Europe. A Greek word therefore before it becomes Anglicised must be transliterated; that is to say, the symbols used in Greek to represent certain sounds must be replaced by those symbols which seem to us to represent similar sounds in English. This transliteration is a matter of great difficulty, and it can scarcely be said that it has been carried out in English with care or consistency. Had we been left to follow our own judgment, no doubt we should have been more successful, but, as our first acquaintance with the history and literature of Greece came from Latin authors, we accepted the method of transliterating Greek words which they adopted. This drove us into many obvious and indisputable errors, of which a typical example may be quoted here. The guttural *k* is always hard in Greek, but in pronouncing the

name *Alcibiades* it is customary to sound the *c* soft in accordance with the English usage. Now, had we transliterated the name direct from Greek, there is little doubt, as there is no *c* in Greek, that we should have spelt it *Alkibiades*, and pronounced the *k* hard; but we got the name *Alcibiades* from the Latin, in which language the Greek *k* was always transliterated to *c*, and then gave the Latin *c* the soft sound of the English *c*. This is only a typical instance of the way in which Greek names have been dealt with in English. A cursory glance at the pages of Grote's *History of Greece* shows us that the result of transliterating Greek words directly into English, instead of through the medium of Latin, is to make them unintelligible to the English reader.

The rule almost universally adopted in pronouncing Greek names in English is to give each letter the sound it has in English, taking care to pronounce all final as well as medial vowels—*e.g.*, *Mer'-o-pe* is a trisyllable, not a dissyllable as it would be in English. It must also be remembered that vowels naturally long in Greek are pronounced long in English, while those that are naturally short are pronounced short. Thus An-tĭg'-ŏ-nē must never be pronounced An'-tĭ-gōne.

Greek vowel.	English sound.	Greek vowel.	English sound.
Ᾱ, ᾱ	As *a* in fāte.	Ῑ ῑ . . .	As *i* in pīn.
Ᾰ, ᾰ	As *a* in făt.	Ο, *o* . .	As *o* in nŏt.
Ε, ε	As *e* in wĕt.	Ω, ω . .	As *o* in nōte.
Η, η	As *ee* in seēn.	Ῡ ῡ . . .	As *u* in cūbe.
Ῐ, ῐ	As *i* in pīne.	Ῠ ῠ . . .	As *u* in cŭb.

The Greek diphthongs are pronounced precisely like similar combinations in English. The only one which presents any difficulty is *ui*, and this is pronounced as *whi* in whine.

The Greek simple consonants are all of them pronounced as the corresponding consonants in English, while the compound consonants φ, θ, χ, and ψ are pronounced as *ph*, *th*, *ch*, and *ps* respectively. Z is pronounced as *dz*, and γ is always hard except before γ, κ, ξ, and χ, when it is sounded as *n*.

The pronunciation of Greek as set forth above, although it is universally adopted in England, is absolutely indefensible from the point of view of accuracy. It has, however, received the sanction of many generations, and is not likely to be readily set aside.

It is a matter of the utmost difficulty to arrive at anything like a certain view of the pronunciation adopted by the ancient Greeks themselves. The following general statements are all that can be ventured upon. The vowels had the same value as the vowels in Latin and modern Italian, except that υ whether long or short, was pronounced like the French *u* or the German *ü*. The consonants in Greek were similar to the consonants in English, except that γ, unlike our *g*, was always hard, and that in Greek there was nothing to correspond to the English soft *c*, which has proved such a stumbling-block in the way of the pronunciation of Greek and Latin. The double consonants φ, θ, and χ were, no doubt, pronounced as two distinct consonants; thus, φ = *p-h*, θ = *t-h*, and χ = *k-h*. Of the diphthongs little can be said with any confidence. In modern Greek they have all approximated to one uniform sound, but this was emphatically not the case in ancient Greek. In all probability each vowel in the diphthong was pronounced separately and distinctly.

III. LATIN.

The pronunciation of Latin rests upon surer ground. In the first place, there is not the difficulty of transliteration to contend with; in the second, the modern languages derived from Latin afford us more evidence as to the ancient language than is the case with Greek. At the outset it must be explained that the custom in English has been to disregard the obvious facts of the case, and pronounce Latin as though it were English. There is, however, in the present day a consensus of opinion against this practice, and the conclusions to which modern scholars have come as to the pronunciation of Latin are briefly stated here.

VOWELS.

ā, as *a* in *father*; never as in *fāte*.
ă, as the same sound shortened; never as in *fat*.
ē, as *ā* in English *stāte*.
ĕ, as *e* in *mĕt*.
ī, as *i* in *machîne*.
ĭ, as *i* in *pĭn*.
ō, between *aw* in *brâw* and *o* in *hōme*.
ŏ, as *o* in *nŏt*.
ū, as *oo* in *foŏl*; never as *u* in *cūbe*.
ŭ, as *u* in *fŭll*; never as *u* in *bŭt*.
y, as German *ü*. It only occurs in Greek words transliterated into Latin.

The rule for the pronunciation of diphthongs is to pronounce the constituent vowels with as much rapidity as possible, so that they are run together.

ae, as the *a* in German.
au, as *au* in German *haus*; *i.e.*, as the *ou* in English *house*, only broader.
ei, as *ei* in English *skêin*, *rêin*.
eu, as *eu* in Modern Italian.
ui, a rare combination in Latin, as in French *oui*.

CONSONANTS.

c, always hard in Latin, never soft, as it so often is in English; *e.g.*, Cicero should be pronounced *Kikero*.
g, always hard, as in *gate*; never soft, as in *gentle*.
n, before *c* and *g*, as *ng*; *e.g.*, incedit is pronounced *ingkedit*
ng, as in *an-ger*, not as in *hang-er*.
j, as *y* in *year*.
v, as *w* in *wine*.
r must always be trilled, whether in the middle or at the end of a word; *e.g.*, per must be pronounced as the *perr* in *per-ry*.
s, always sharp, as in *hiss*; never as in *his*: *e.g.*, *dens* is pronounced *dense*.
bs, as *ps*.
ti before a vowel has its proper sound, and is never pronounced *sh*, as in English.
ph, *ch*, *th*, were not pronounced as one sound, as in English, but as *p-h*, *k-h*, and *t-h*.

In the table given above those consonants only are set down the pronunciation of which differs from that to which English people are accustomed. The consonants omitted in the list are pronounced in Latin precisely as in English.

QUANTITY.

Every vowel in Latin is either long or short, according as the voice dwells upon it or not. In pronouncing Latin a distinction must always be made between long and short vowels. For instance, we should say ă-mo, not ā-mo.

The quantity of a vowel in Latin is influenced by two considerations: 1. By position; 2. By the natural length of the vowel.

1. *Position.*—(1) A vowel followed by another vowel, or by *h* and a vowel is short; *e.g.*, mĕus, mĭhi, prăĕustus. (2) A vowel followed by two consonants, or by *x* or *z*, is long; *e.g.*, amānt, strīx. To this rule there is the following exception: if a short vowel is followed by two consonants, the first of which is a mute, or *f*, and the second a liquid, the vowel may be treated as either short or long; *e.g.*, tenĕbrae, volŭcris, &c. In English it has long been the custom to pronounce a vowel followed by two consonants as though it were short. Thus, it is usual to say amăns, infĕnsus, &c. This, however, is incorrect. As far as verse-making is concerned, every vowel followed by two consonants in Latin is treated as long, but in pronunciation some vowels followed by two consonants are *pronounced* long, some short. Thus we say ĕs-tis, but rēc-tus. The following brief rules will prove a rough guide in this matter. A vowel was always pronounced long before the combinations *ns, nf, gn*; *e.g.*, amāns, infēnsus, sīgnum; also before *x, ct, ps,* and *pt,* when these combinations come from *gs, gt, bs, bt,* respectively; *e.g.*, rēxi, rēctus, scrīpsi, scrīptum.

2. *Natural length of the vowel.*—The following rules determine the natural length of a vowel, unaffected by position.

(1) Vowels not in the final syllable. No rule can be laid down for the natural quantity of root vowels, each root must be studied separately; but there are certain cases in which vowels are known to be long: (*a*) All diphthongs are long; *e.g.*, paucae, coepi, except before another vowel, the diphthong sometimes becomes short by position. (See 1. (1).) (*b*) All vowels, which have resulted from the contraction of two separate syllables are long; *e.g.*, cōgo (for cŏăgo). (2) For the quantity of vowels in the final syllable, there are certain general rules, but these admit of many exceptions, which cannot be systematically arranged without discussing the subject of Latin inflexions. Generally speaking (*a*) Monosyllables are long, *e.g.*, pēs, mōs; (*b*) when the word ends with a vowel, *a* (except as an ending of the ablative case) and *e* final are short, musă, Carthaginĕ; *i, o, u* final are long, dominī, amō, genū; (*c*) when the word ends with a single consonant the final syllable is short, *e.g.*, amăt, urbĭs; except that, *a, o, e* before *s* are long, *e.g.*, amās, deōs, urbēs. To all these rules there are many exceptions, which, however, scarcely affect the pronunciation of proper names.

ELISION.

Where a word ending in a vowel or a vowel followed by *m* preceded a word beginning with a vowel or *h*, the final vowel or vowel with *m* was disregarded for the purposes of scansion. This final syllable was not, however, altogether lost in pronunciation, but sounded lightly, the voice hardly dwelling on it at all.

The accent in Latin differed entirely from the accent in English, which may be defined as an emphasis laid on a certain syllable, while the Latin accent was more a matter of pitch than of stress. Space does not allow the question of accent to be discussed here. It need only be said that in Latin every monosyllabic word has the accent, that dissyllables have the accent on the penultimate, and that words of more syllables than two have the accent on the antepenultimate if the penultimate is short, and on the penultimate if it is long,

THE METRIC SYSTEM.

The metric or decimal system, long in use in France, and now adopted in other European countries and to some extent in the United States and Great Britain, calls for special attention from its prominent importance among systems of weights and measures. It is based upon the metre, the unit of length, which is approximately $\frac{1}{10000000}$ part of the distance from the equator to the pole, or = 39.37 inches.

The Square Metre is the unit of measure of small surfaces.

The Are = 100 square metres, is the unit of measure for land surfaces.

The Stere, or Cubic Metre, is the unit of measure for volumes.

The Litre, a cube whose edges measure $\frac{1}{10}$ of a metre, is the unit of capacity.

The Gramme, the weight of a cube of distilled water whose edges measure $\frac{1}{100}$ of a metre, is the unit of weight.

Persia.—The unit of account is the toman, an uncoined standard, divided into 8 reals, 10 sahib-karauns, 20 panabats, 50 abassis, 100 mamodis, 200 shahies, or 10,000 altens. In some places accounts are kept in piastres = 4 shahies. A purse is 50 tomans, worth about $125.00.

Peru.—The unit is the piastre or peso of 100 centesimos. It is represented by the silver sol, a coin of the same value as the French 5 franc piece, or 96.5 cents.

Portugal.—The unit of account here is the rei; and 1000 reis is called a milrei, whose value is about $1.08. A million reis is termed a conto.

Roumania.—The monetary unit is the lei nuove of 100 bani, a coin about equal to the French franc in value. Russian and Austrian coins are largely used.

Russia.—The standard of value is the ruble, divided into 100 kopecs; its value is 77.2 cents. Accounts were formerly kept in paper or bank rubles, but in 1839 the silver ruble was made the only unit of value in the empire. There are numerous coins, of various titles, the largest being the gold imperial, of 10 rubles.

Siam.—The circulating medium consists only of silver and cowrie-shells. The general coin is the bat or tical, commonly valued at about 60 cents. It is divided into 4 salungs, 8 fuangs, 16 song-p'hais, 32 p'hainungs, or 6400 cowries.

Spain.—The unit of account since 1871 has been the silver peseta, of 4 reals or 100 centesimos, its value the same as the French franc. The gold coins consist of doubloons and pistoles. The real vellon, a very common coin, is worth 5 cents. The silver dollar, equal in value to the American dollar, is in common circulation.

Sweden.—The unit is the krona or crown of 100 öre, as in Denmark and Norway, and of the same value.

Switzerland.—The unit of account is the franc of 100 rappen or centimes, equal in value to the French franc. The coins are like those of France.

Tripoli.—The standard of value, as in Turkey, is the piastre of 40 paras. Its value is fluctuating. Commerce is conducted chiefly with Spanish dollars or 5 franc pieces.

Tunis.—Accounts are stated in piastres of 16 carobas or 52 aspers. The piastre is worth about 12 cents. Business is conducted in dollars and francs.

Turkey.—The piastre (*grusch*) is here the unit of account. It is divided into 40 paras or 120 aspers; also into 100 cents. The piastre is worth about 4.4 cents. The medjidie or lira, a gold coin, is worth $4.40.

United States.—The unit of value is the dollar, divided into 100 cents. The principal coins are: gold, the eagle (10 dollars), half-eagle, and quarter-eagle; silver, the dollar, half- and quarter-dollar, and the dime (10 cents); nickel, the half-dime; bronze, the cent.

Venezuela.—The former unit of account was the peso or dollar of 100 cents, but it has been superseded by a new peso equal to 5 francs in value.

West Indies.—The money of account of the several islands agrees in general with that of the country to which they belong. In Cuba accounts are settled in dollars, divided into 100 cents, or 8 reals, each of 34 maravedis. The Spanish dollar agrees with that of the United States in value.

NAMES OF STATES AND TERRITORIES, AND THEIR DERIVATION.

Alaska. An Indian title, spelled by the Russian explorers Al-áy-es-ka; since changed successively to Aliaska, Alaksa, Alashka, and Alaska. When purchased by the United States several names were proposed, but Alaska was adopted at the suggestion of Charles Sumner.

Alabama. A Muscogee Indian word, meaning "Here we rest," the name given by the Indians to the principal river of the State, and adopted in 1817 as the State name.

Arkansas. Name adopted in 1819, from its principal river. Alkansas or Arkansas was the title given by the Algonquins to the tribe which called itself Quappas. The pronunciation was fixed, by act of the State Legislature in 1881, as "Ar'kan-saw."

Arizona, There are several derivations suggested: 1st, from an Indian word meaning "sand hills;" 2d, from Aztec *Arizuma*, meaning "silver-bearing;" 3d, from a goddess of the Zuni Indians, named Arizonia.

California, "Las Sergas de Esplandian," a Spanish romance published in 1510, has among its characters a queen named Calafia, living in an island kingdom named California, which is "rich with gold, diamonds, and pearls." Cortez is supposed to have given this name to the newly-discovered district of Lower California, from his hopes that it would prove a land of gold. Several other derivations have been suggested, but this seems the most probable.

Colorado. Named from its principal river, whose name comes from a Spanish word signifying red or ruddy, the waters being reddened by sand, mud, etc. after heavy rains. But it may possibly have been derived from Vasquez Coronado, who led a Mexican body of explorers hither in 1540.

Connecticut. From the Mohegan Indian word *Quonaughticot*, given to the river, and meaning either "long river" or "river of pines." The Indian word is variously spelled, *Quinetuequet* having the nearest resemblance to Connecticut.

Dakota. So named from the Dakota Indians, a tribal name meaning "allied," and referring to the great confederacy of tribes inhabiting the region. Before this alliance the Dakotas were known as the Sioux.

Delaware. This name was originally—in 1703—given to Delaware Bay, in honor of Lord De la War, governor of Virginia in 1611. The State adopted the name from the bay.

District of Columbia. Columbia is the feminine form of the word Columbus, and as such may stand for the emblematic goddess of the country.

Florida. This title was given by Ponce de Leon, who discovered the land on Easter Sunday, March 27, 1513. This day being called by the Spaniards *Pascua Florida*, "Holy Day of Flowers," he called the country Florida.

Georgia. So named in honor of George II., king of England, who established a colony here in 1732.

Idaho. *Edah hoe*, a phrase from the language of the Nez Percé Indians, descriptive of the gleam of the snowy mountain-summits in the sunlight, has been Anglicized into Idaho, which is poetically converted into "gem of the mountains."

Illinois. This name was adopted in 1809 from that of the Illinois River. It is said to come from the Indian word *Illini*, "men," and the French termination *ois*, "tribe." A derivation is also suggested from an island in the Mississippi abounding in nuts, and called by the French *isle aux nois*, "isle of nuts."

Indiana. This title was adopted from the name Indian, which was applied in 1768 to a tract of land north of the Ohio River, then granted by the Indians to a company of traders.

Iowa. Several derivations are suggested for the name of this State. 1st, the French corruption of *Ayuhba*, an Indian word meaning "the sleepy ones;" 2d, a Sioux name of the Pahoja tribe; 3d, the Indian word *Ajawa*, "across, beyond"—as "the tribe beyond the river," corrupted in French to *Aiouès*, thence to Iowa.

Kansas. Adopted in 1854, from the name of its principal river, which was so called from the Indian tribe known as Konsos or Kows, "smoky water." Spelt Canson, Kanson, Kanzas, and finally, by legislative action, Kansas.

Kentucky. Adopted in 1782, from its principal river. Trumbull derives it from an Indian word *Kain-tuk-ee*, "at the head of the river." It has also been supposed to come from an Algonquin word meaning "long river," and from *Kentakchowa*, "long prairies."

Louisiana. Named by La Salle, in 1682, in honor of Louis XIV. king of France.

Maine. Said to have been named by Sir Ferdinando Gorges, who obtained a royal grant of land in this region, in honor of Henrietta Maria, wife of Charles I., and to be derived from the French province of Maine, her patrimonial estate. But as there is no proof that she had anything to do with this province, and as the land seems to have been called *The Main* at an earlier date, it is probable that the name originated in the latter term.

Maryland. This State was named from the queen mentioned in connection with Maine, Henrietta Maria, wife of Charles I. In the patent to Lord Baltimore it was named "Crescentia," but the king, on signing the patent, desired that the name should be changed to *Terra Maria*, "Mary's Land," in honor of his queen.

Massachusetts. Several derivations of this word are suggested, the most probable being from the Natic Indian word *Masasuset*, whose approximate meaning is "the place of the great hills"—referring to the Blue Mountains.

Michigan. From the name of the lake. Trumbull ascribes it to an Indian word meaning "a fish weir." The word *Mitchikan* occurs in the Ottawa dialect, and means "fences." Also ascribed to Algonquin and Chippewa words meaning "great lake."

Minnesota. This State took its name from St. Peter's River, whose Indian name was *Minni-sotah*, "muddy (or slightly turbid) water." When admitted as a State the names Itasca, Chippeway, Jackson, and Washington were proposed but rejected.

Mississippi. Name adopted in 1790, from the great river. The original name of the river in Algonquin, as corrupted into French, is *Méché Sébé*, "the father of waters." This term was successively changed to *Michi Sepe*, *Michisepe*, *Misisipi*, *Missisipi*, *Mississipi*, and finally *Mississippi*, it being thus gradually overloaded with consonants. Various other spellings are given.

Missouri. From the Missouri River. The word is said to be a compound from two different languages—*Mis*, Algonquin, "great," and *Souri*, Dakota, "muddy." Other derivations are given, as Dakota *Minné-shosha*, "muddy water."

Montana. From Spanish *Montaña*, "a mountain." The name was suggested to Hon. James Ashley, chairman of the House Committee on Territories, in 1864, and applies to the very mountainous character of the region embraced.

Nebraska. This name is derived from the Indian name of the Platte River. It means "shallow water" or "water valley."

Nevada. From the Sierra Nevada Mountains. *Serrado*, "serrated," *Nevada*, "snowy;" thence "snowy mountains."

New Hampshire. So named by John Mason, who obtained title to this province in 1639, from the county of Hampshire, England, of whose town of Portsmouth he was governor.

New Jersey. In 1664, when this district was conveyed by the Duke of York to Lord John Berkeley and Sir George Carteret, the conveyance provided that it should be called "Nova Cesarea or New Jersey," in compliment to Carteret, who had defended the Isle of Jersey against the parliamentary armies.

New Mexico. Named to distinguish it from "Old" Mexico. The name comes from that of the Aztec deity "Maxitli." The territory was named *Nova Mexicaña* by Antonio de Espejo at the date of the settlement of Santa Fé.

New York. This name was given in compliment to the Duke of York, afterward James II., to whom the province was granted in 1664.

North Carolina. The name Carolana was given in 1564, when the district later known as "The Carolinas" was settled by Huguenots in the reign of Charles IX. of France. The English preserved the name, with a slight change of spelling, in honor of Charles II. of England. The colony was afterward divided into North and South Carolina.

Ohio. So named from the Ohio River. The word is variously derived; from Iroquois *Ohëo*, "beautiful;" from *Ohiupeekhanne*, "stream white with froth;" and from Seneca *Oheeyegahunda*, "beautiful river."

Oregon. This title is derived from the Spanish name for the wild sage or "artemisia," *Orégana*, which grows abundantly on the banks of the Columbia River, which hence was named the Oregana. The word was corrupted by the trappers to Oregan, and eventually applied, as Oregon, to the State. Other derivations have been suggested.

Pennsylvania. William Penn's first purpose was to call his province "New Wales," but he afterward suggested the word *Sylvania*, to designate its forested condition. To this Charles II., in 1681, added the word "Penn," that the name might signify "Penn's woods."

Rhode Island. Named from Rhode Island, in Narragansett Bay. The origin of the name is unknown. It may have been derived from the Isle of Rhodes in the Mediterranean, or possibly from the Dutch word *Roode*, "red," in reference to certain red clay banks, or from the reddish appearance given to it by its abundance of cranberries.

South Carolina. See North Carolina. Carolina was divided into North and South in 1729.

Tennessee. Name derived from that of its principal river, which in its turn came from Indian *Tuensas*, "river of the great bend;" or perhaps from *Tenas See*, a Cherokee village on its banks, said to mean "a curved spoon."

Texas. Derived from *Tehas*, "friendly," the name of a village inhabited by a small Indian tribe. Various other derivations are given, as *Tejas* or *Texas*, "friends," Aztec *Tehajas*, "north country," *Tejas*, "the mound prairies," and the Teyas Indians, mentioned by Vasquez Coronado.

Utah. This name was derived from that of the Ute, Utah, or Yuta tribe of Indians, the name meaning "dwellers in mountains." The Mormons wished it to be called Deseret, "honey bee," but the present name was adopted through the action of Hon. Edward Everett, then Secretary of State.

Vermont. From the French name, *vert mont*, which was given to the mountains of this section by the French of Canada, and adopted by the settlers in 1777 as the name of the State.

Virginia. Queen Elizabeth characterized the discovery of this region by Raleigh's expedition as the most glorious event of her reign, and in 1584 gave it the name of Virginia, as a memorial of her virgin or unmarried state.

Washington. So named, when formed into a Territory, in honor of George Washington.

West Virginia. So called on its separation from Virginia in 1863. It was at one time proposed to call it Kanawha, from its principal river.

Wisconsin. The Wisconsin River, from which the State was named, was entitled by Marquette *Masconsin*, "wild rushing channel." This was changed into *Ouisconsin*, and thence to Wisconsin. There are various other spellings.

Wyoming. From the Wyoming Valley of Pennsylvania, whence emigrants came to this region. The word comes from the Delaware Indian *m'cheuomi* or *m'cheuwami*, "great plain."
